1. Introduction

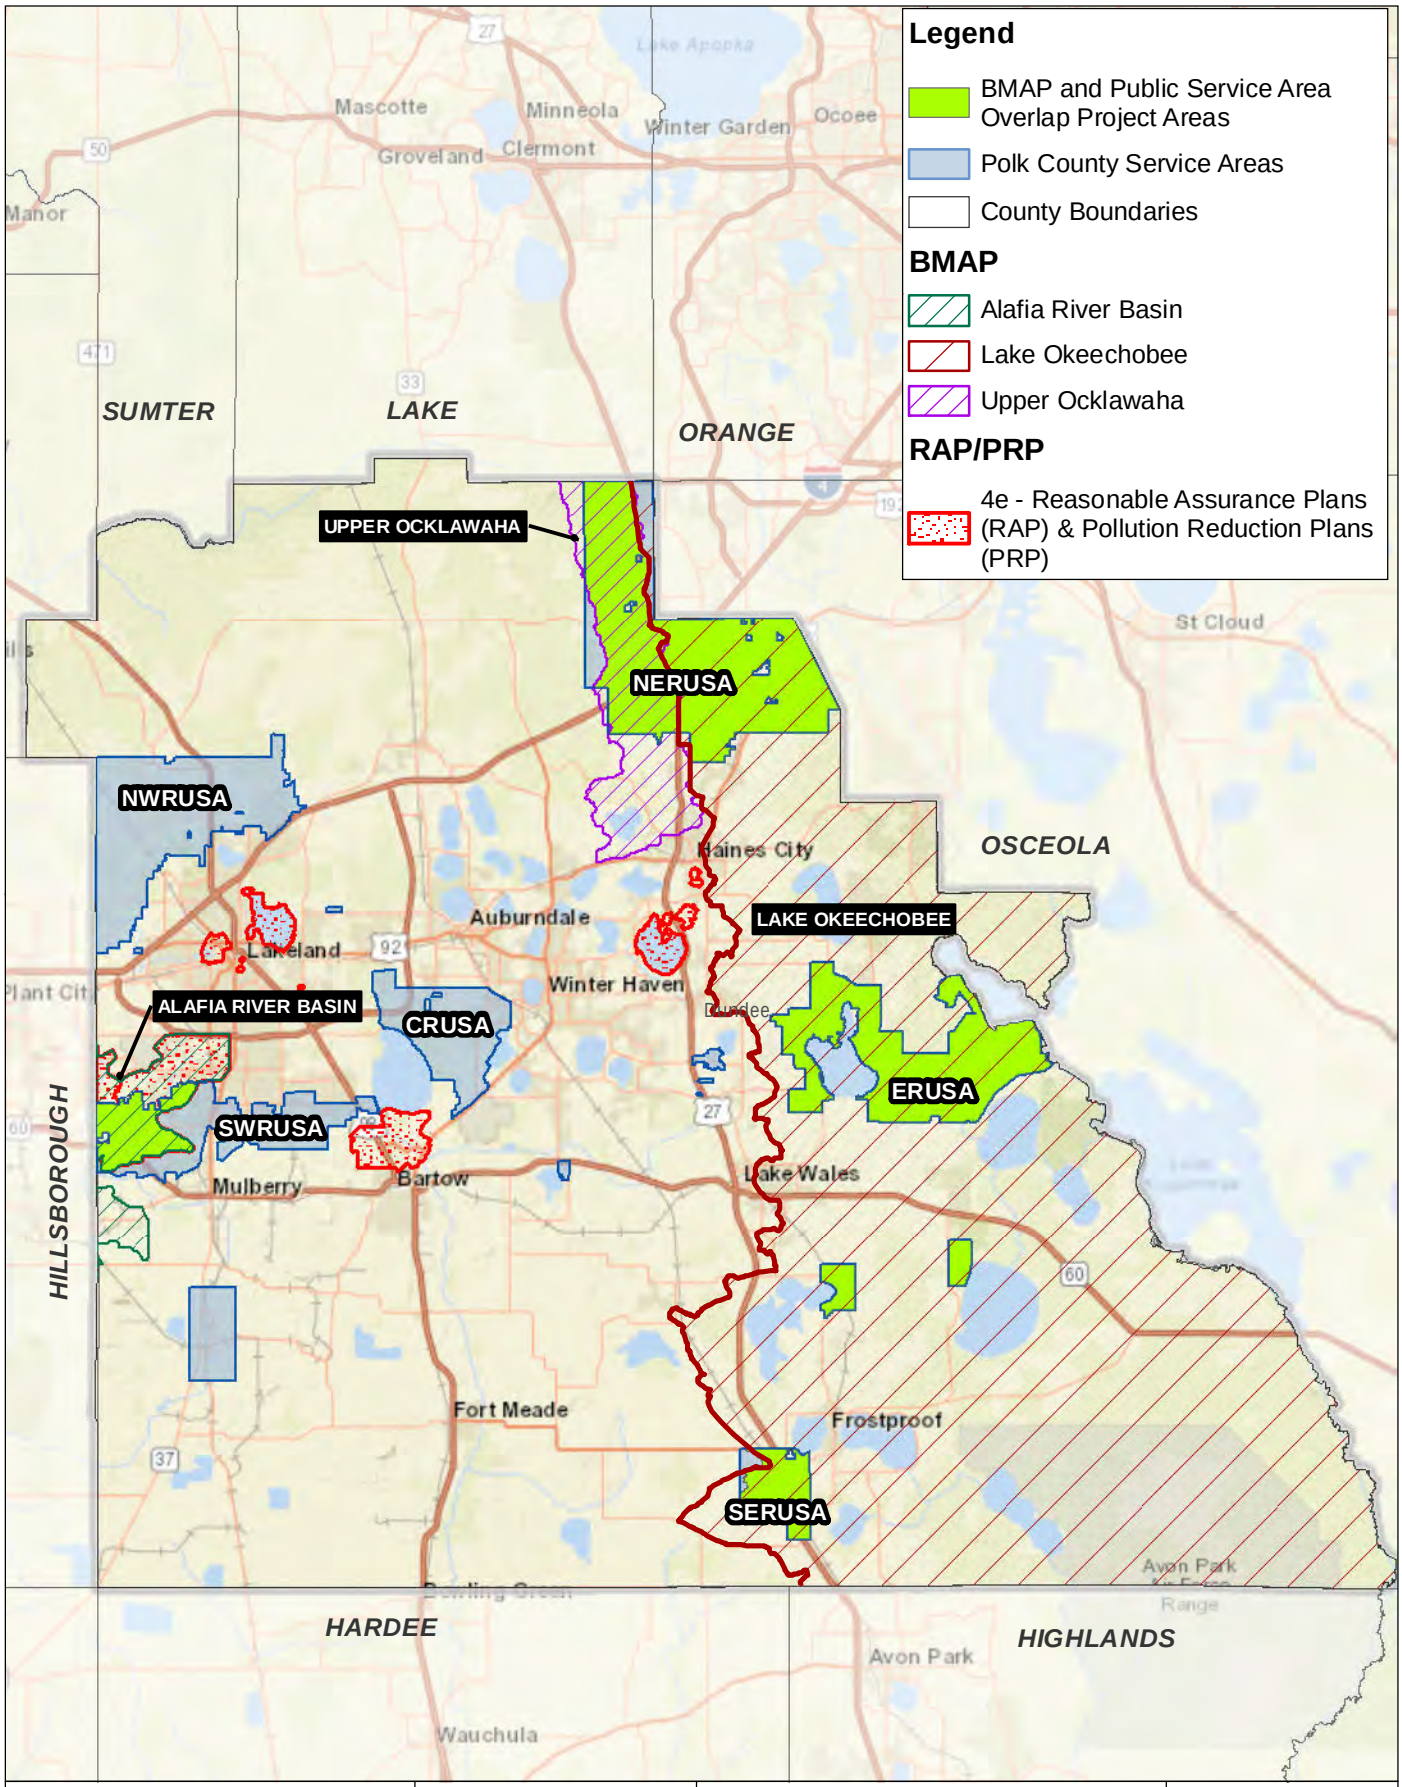

1.1 Purpose

Subparagraph 403.067(7)(a)9., Florida Statutes, specifies that local governments within a Basin Management Action Plan ("BMAP") must develop a wastewater treatment plan and/or onsite sewage treatment and disposal system ("OSTDS") remediation plan containing certain information, **if** the Florida Department of Environmental Protection ("Department" or "FDEP") "identifies domestic wastewater treatment facilities or onsite sewage treatment and disposal systems as contributors of at least 20 percent of point source or nonpoint source nutrient pollution **or if** the Department determines remediation is necessary to achieve the total maximum daily load ("TMDL").

On June 12, 2023, the Department issued a **Final Order** for OGC Case No. 23-001 to 0135 signed by Secretary Shawn Hamilton. In this Final Order, FDEP determined "domestic wastewater treatment facilities and/or OSTDS sources within specified BMAPs meet the 20 percent contribution threshold and/or remediation of these sources is necessary to achieve the BMAP for a nutrient TMDL pursuant to 403.067(7)(a)9". The BMAPs specified in the order overlapping with portions of Polk County's service areas are the Alafia River Basin (23-0112), Lake Okeechobee (23-0119), and the Upper Ocklawaha River Basin (23-0125) (**Figure 1-1**). Although FDEP did not provide a provide a determination for the percent contribution of either wastewater treatment and/or OSTDS in the BMAPs overlapping Polk County, FDEP staff indicated the requirement for an OSTDS remediation plan is "necessary to achieve the total maximum daily load." Additional BMAP information and links are provided in the following table:

Table 1-1: BMAP Reference Information

BMAP	FDEP Reference	Water Quality Objective
Alafia River Basin	https://floridadep.gov/sites/default/files/alafia-bmap.pdf	• Alafia River TMDL requires 54% reduction of Total Nitrogen (TN) from MS4 and nonpoint source loads • Tampa Bay Reasonable Assurance Plan includes allocation to Polk County's MS4 of 67.5 tons/year of TN
Lake Okeechobee	https://floridadep.gov/sites/default/files/LakeO-BMAP-APR-2015.pdf	• Requires WWTFs with reuse to meet TP of 6 mg/L and TN of 10 mg/L • TMDL established load limit for TP only (140 metric tons/year), and required reductions for nonpoint sources are for TP only
Upper Ocklawaha River Basin	https://floridadep.gov/sites/default/files/AdoptedUpOcklawahaBMAP.pdf	• BMAP focuses on TP and required reductions vary by waterbody

1.2 Required Content per Final Order

Paragraphs 7-14 of the Final Order describes the OSTDS remediation plan's required content including:

7) An inventory of the OSTDS
8) An estimate of future growth in new OSTDS over the next 20 years in the local government's jurisdiction or service area
9) An inventory of OSTDS that are expected to be eliminated over the next 20 years through connection to central sewer or other distributed wastewater system with additional nutrient reduction
10) Identification of deadlines and interim milestones for the planning, design, and construction of new/extended central sewer and OSTDS connection to these lines
11) Estimated costs for the projects identified in paragraph 10
12) For OSTDS not expected to be eliminated over the next 20 years, an estimate number that will required upgrading to enhanced nutrient-reducing OSTDS or participating in a distributed wastewater treatment system with added nutrient reduction.
13) Estimated costs for upgrading to enhanced nutrient-reducing OSTDS identified in paragraph 12
14) Any other cost-effective and financially feasible projects necessary to achieve the nutrient load reduction for OSTDS to meet the water quality objectives of the BMAP

1.3 Existing Legislative Requirements Related to Septic Tanks

Pursuant to Section 381.00655, Florida Statutes (F.S.), owners of properly functioning septic tanks are required to connect to available sewers within one year after written notification that central sewers are available and owners of failed septic tanks must connect within 90 days after written notification from the Department, unless an extension is granted for financial hardship.

HB 1379 (2023) revised section 403.067(a)10., F.S., to prohibit new septic tanks within BMAP, Reasonable Assurance Plan (RAP), and Pollution Reduction Plan (PRP) areas where sewer is available. If central sewer is not available, new septic tanks on lots one acre or less must be an "enhanced" system that achieves 50% nutrient reduction compared to standard septic tanks. There are several impaired waters within Polk County having approved Pollutant Reduction Plans; however, these areas are either outside the County's service areas (Lake Bonnet, Crystal Lake, Little Lake Hamilton, Lake Eva, Lake Parker, Middle Lake Hamilton, Lake Morton, Lake Mirror, Saddle Creek below Lake Hancock, and Lake Hamilton) or overlap a BMAP area (the Poley Creek PRP for fecal coliforms overlaps with the Alafia River Basin BMAP). For these reasons, these areas are not addressed separately in the Plan.

HB 1379 also requires local governments to a) develop a plan to provide sewer service for developments of more than 50 residential lots having more than one septic tank per acre within a 10-year planning horizon, b) update Comp Plans to include a sanitary sewer planning element by July 1, 2024, and c) provide the Department with an annual update on the status of the construction of sanitary sewers to serve areas that are subject to a BMAP or located within the basin of waters not meeting applicable nutrient-related water quality standards. To comply with the requirements of HB 1379, the County is drafting Comprehensive Plan revisions. Staff anticipate the recommendations will be presented at the March 2024 Planning Commission meeting for consideration.

1.4 Remediation Plan Submittal Requirements

To comply with the Final Order, the County will submit the draft OSTDS remediation plan for the Department's review by February 1, 2024. By August 1, 2024, the County will submit a complete OSTDS remediation plan that addresses Department comments on the draft. The draft and complete plan will be electronically submitted to the Department to Moira Homann at BMAPProgram@floridadep.gov.

2. Plan Approach

Polk County is an advocate for improving the water quality in the BMAP areas, however, there are challenges with planning since neither the BMAPs nor the underlying Total Maximum Daily Loads (TMDLs) for the BMAPs provide specific allocations (or required reductions) for septic tanks. The approach to this Remediation Plan focuses on efforts to comply with the previously described statutory requirements related to septic tanks and provides the required Final Order content.

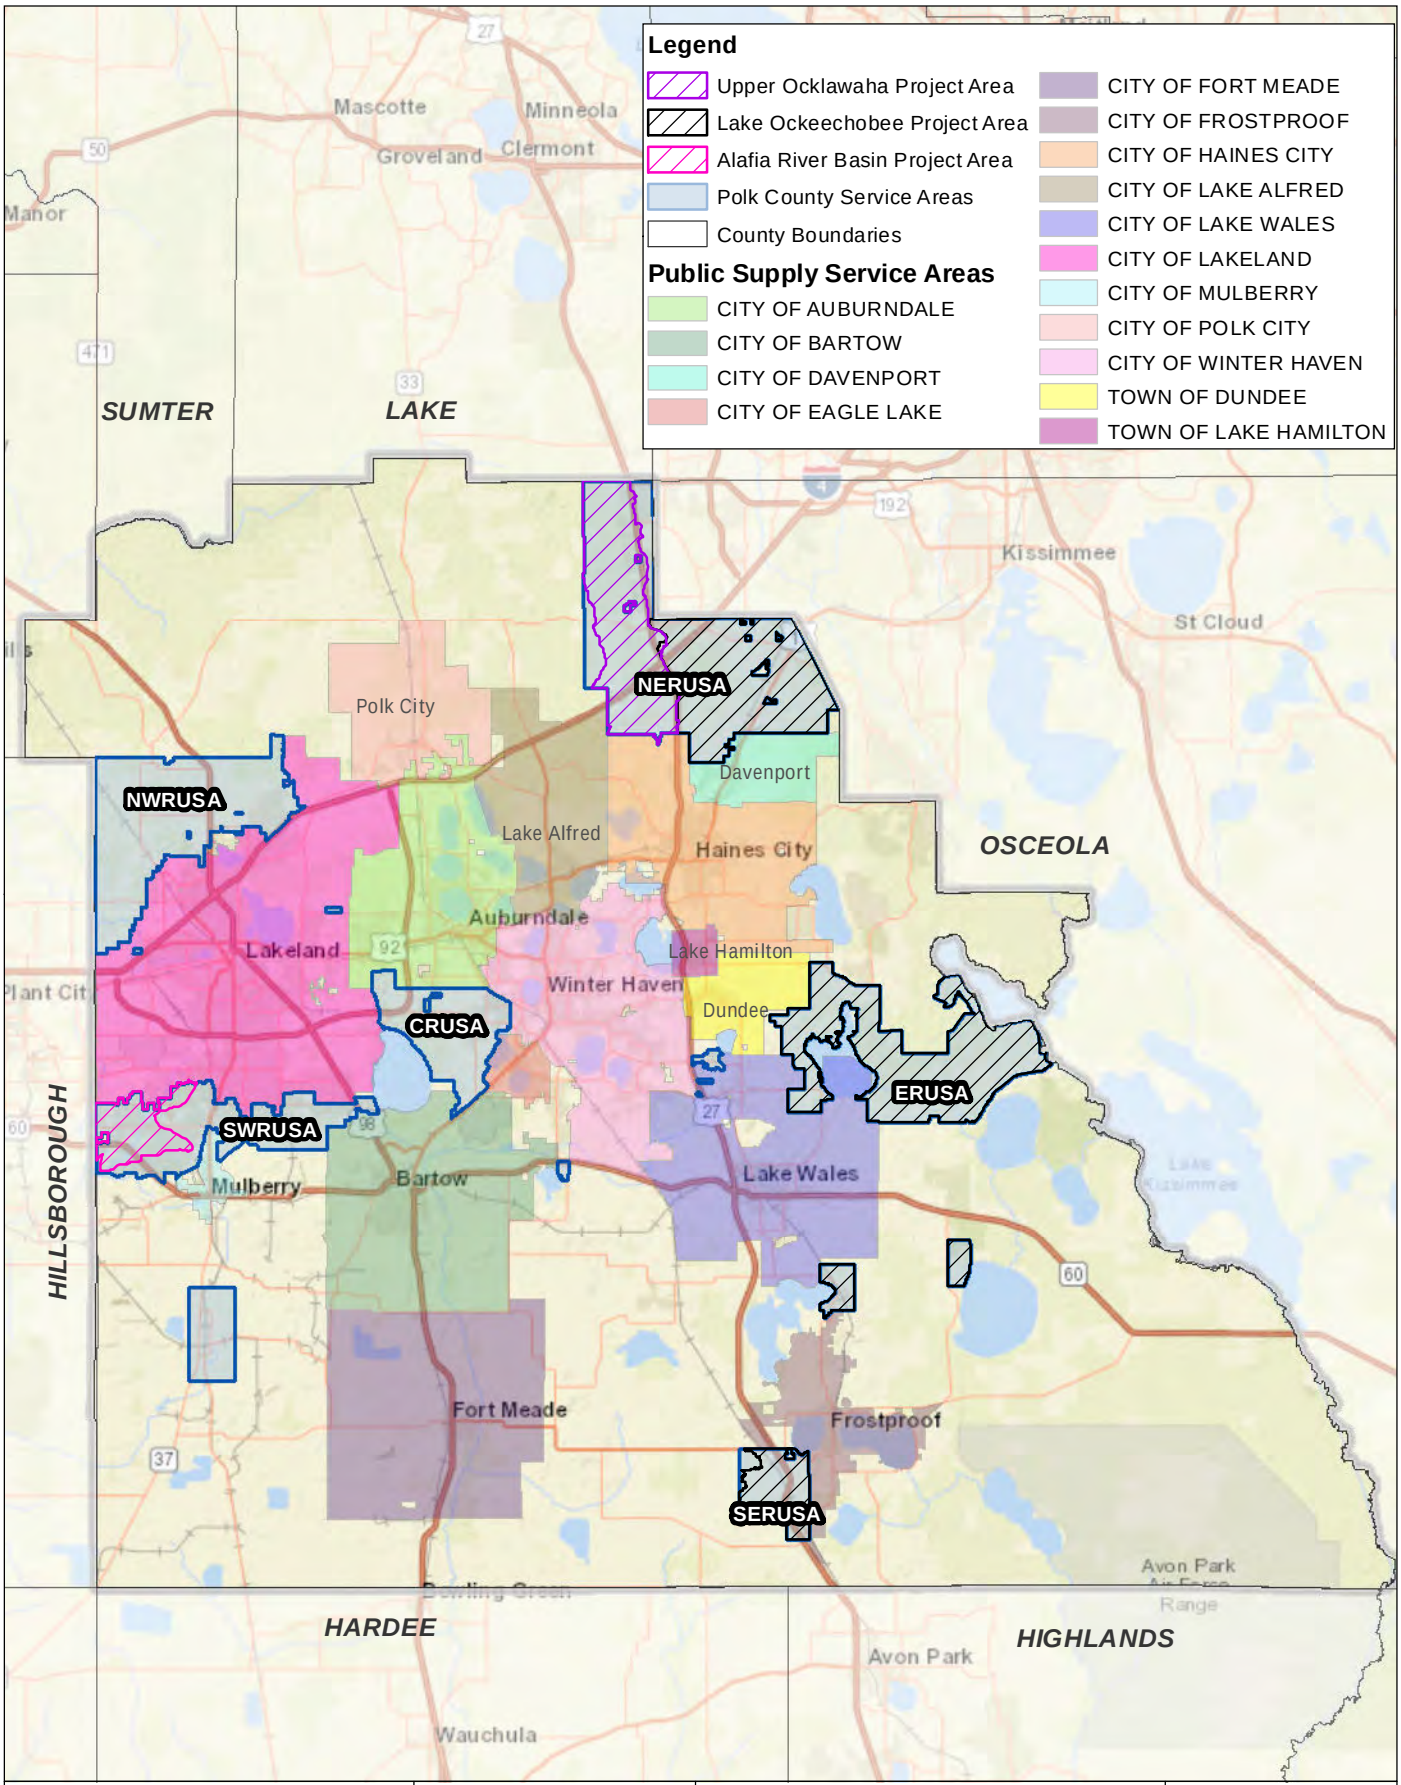

2.1 Data Sources

County information was gathered from a variety of sources and includes

- The number of septic tanks within service areas based on current sewer infrastructure
- Planned expansions and/or new sewer infrastructure
- Growth information for estimating the number of new septic tanks in the BMAP areas (within the service areas and without available central sewer). Additional estimations for number of these new tanks which are required to be enhanced systems.
- Proposals for revising the Comprehensive Plan and Land Development Code to incorporate new, more stringent septic system requirements.

2.2 Jurisdiction

This plan addresses septic tanks within the County's utility service areas and does not address septic tanks in other unincorporated areas of the County, outside of the established service areas. The unincorporated areas of the County outside of the County's service areas encompass approximately 53% of Polk County but only accounts for about 15% of the County's total population. These areas are not addressed in the plan because the septic tanks outside of the County's service areas are permitted by the Department and not within Polk County Utilities jurisdiction. Of the areas in the County served by a public utility (approximately 47% of Polk County), roughly 23.6% (221.5 sq-mi) of that area is under the County's jurisdiction (refer to **Figure 2-1**). While the County does not have the authority to plan or provide sewer service in areas under the control of other local municipalities, the County contacted all local municipalities/utilities regarding the development of the Plan as part of the informational gathering process. As of the date of this draft report, the County had only received a response from the Toho Water Authority but anticipates additional information may be received prior to finalizing the August 1, 2024, Plan (see **Appendix A**).

3. Polk County's Service Areas within BMAP Watersheds

Polk County has four regional utility service areas within a BMAP watershed listed in the Final Order. The Service areas are the Southwest Regional Utility Service Area (SWRUSA), Northeast Regional Utility Service Area (NERUSA), East Regional Utility Service Area (ERUSA), and Southeast Regional Utility Service Area (SERUSA). **Table 3-**1 and **Figure 1-1** describe the service area and the associated BMAP.

Table 3-1: Service Areas and Associated BMAPs

Service Area	BMAP	Description
SWRUSA	Alafia River	Part of the Southwest Regional Utility Service Area (SWRUSA) falls within the Alafia River BMAP watershed
NERUSA	Upper Ocklawaha	42.5% of the Northeast Regional Utility Service Area falls within the Upper Ocklawaha watershed
NERUSA	Lake Okeechobee	49.8% of the NERUSA is in the Okeechobee BMAP watershed
ERUSA	Lake Okeechobee	The majority of the East Regional Utility Service Area (ERUSA) is in the Okeechobee BMAP watershed
SERUSA	Lake Okeechobee	The Southeast Regional Utility Service Area (SERUSA) falls within the Lake Okeechobee BMAP watershed

3.1 SWRUSA Description

The SWRUSA encompasses approximately 52 square miles in the southwest portion of Polk County. Within SWRUSA, PCU owns and operates 50 miles of wastewater force mains, 103 miles of wastewater gravity sewers, and one regional wastewater treatment facility.

3.2 NERUSA Description

The Northeast Regional Utility Service Area (NERUSA) is approximately 72 square-miles in the northeast corner of Polk County and neighbors Lake, Orange, and Osceola Counties. Within NERUSA, PCU owns and operates approximately 990 miles of wastewater force mains, 210 miles of wastewater gravity mains, 160 lift stations, and one regional wastewater treatment facility. There are over 23,000 wastewater connections in NERUSA.

3.3 ERUSA Description

The East Regional Utility Service Area (ERUSA) is approximately 13.5 square-miles in the eastern Polk County. The ERUSA is split into two distinct systems, the Waverly and the East systems, which are separated by the Lake Wales Ridge. Wastewater collected in the Waverly system is conveyed to the Waverly Wastewater Treatment Facility and wastewater collected in the East system is convey to the Toho Wastewater Treatment Facility. Within the ERUSA combined systems, PCU owns and operates approximately 6.3 miles of wastewater force mains, 9.3 miles of wastewater gravity mains, 10 lift stations, and the Waverly WWTF.

3.4 SERUSA Description

The portion of the SERUSA served by the County encompasses approximately 14.5-square miles in southeast Polk County. Within the SERUSA, PCU owns and operates 5 lift stations, 5.6 miles of wastewater gravity sewers, 11.4 miles of wastewater force mains, and one regional wastewater treatment facility.

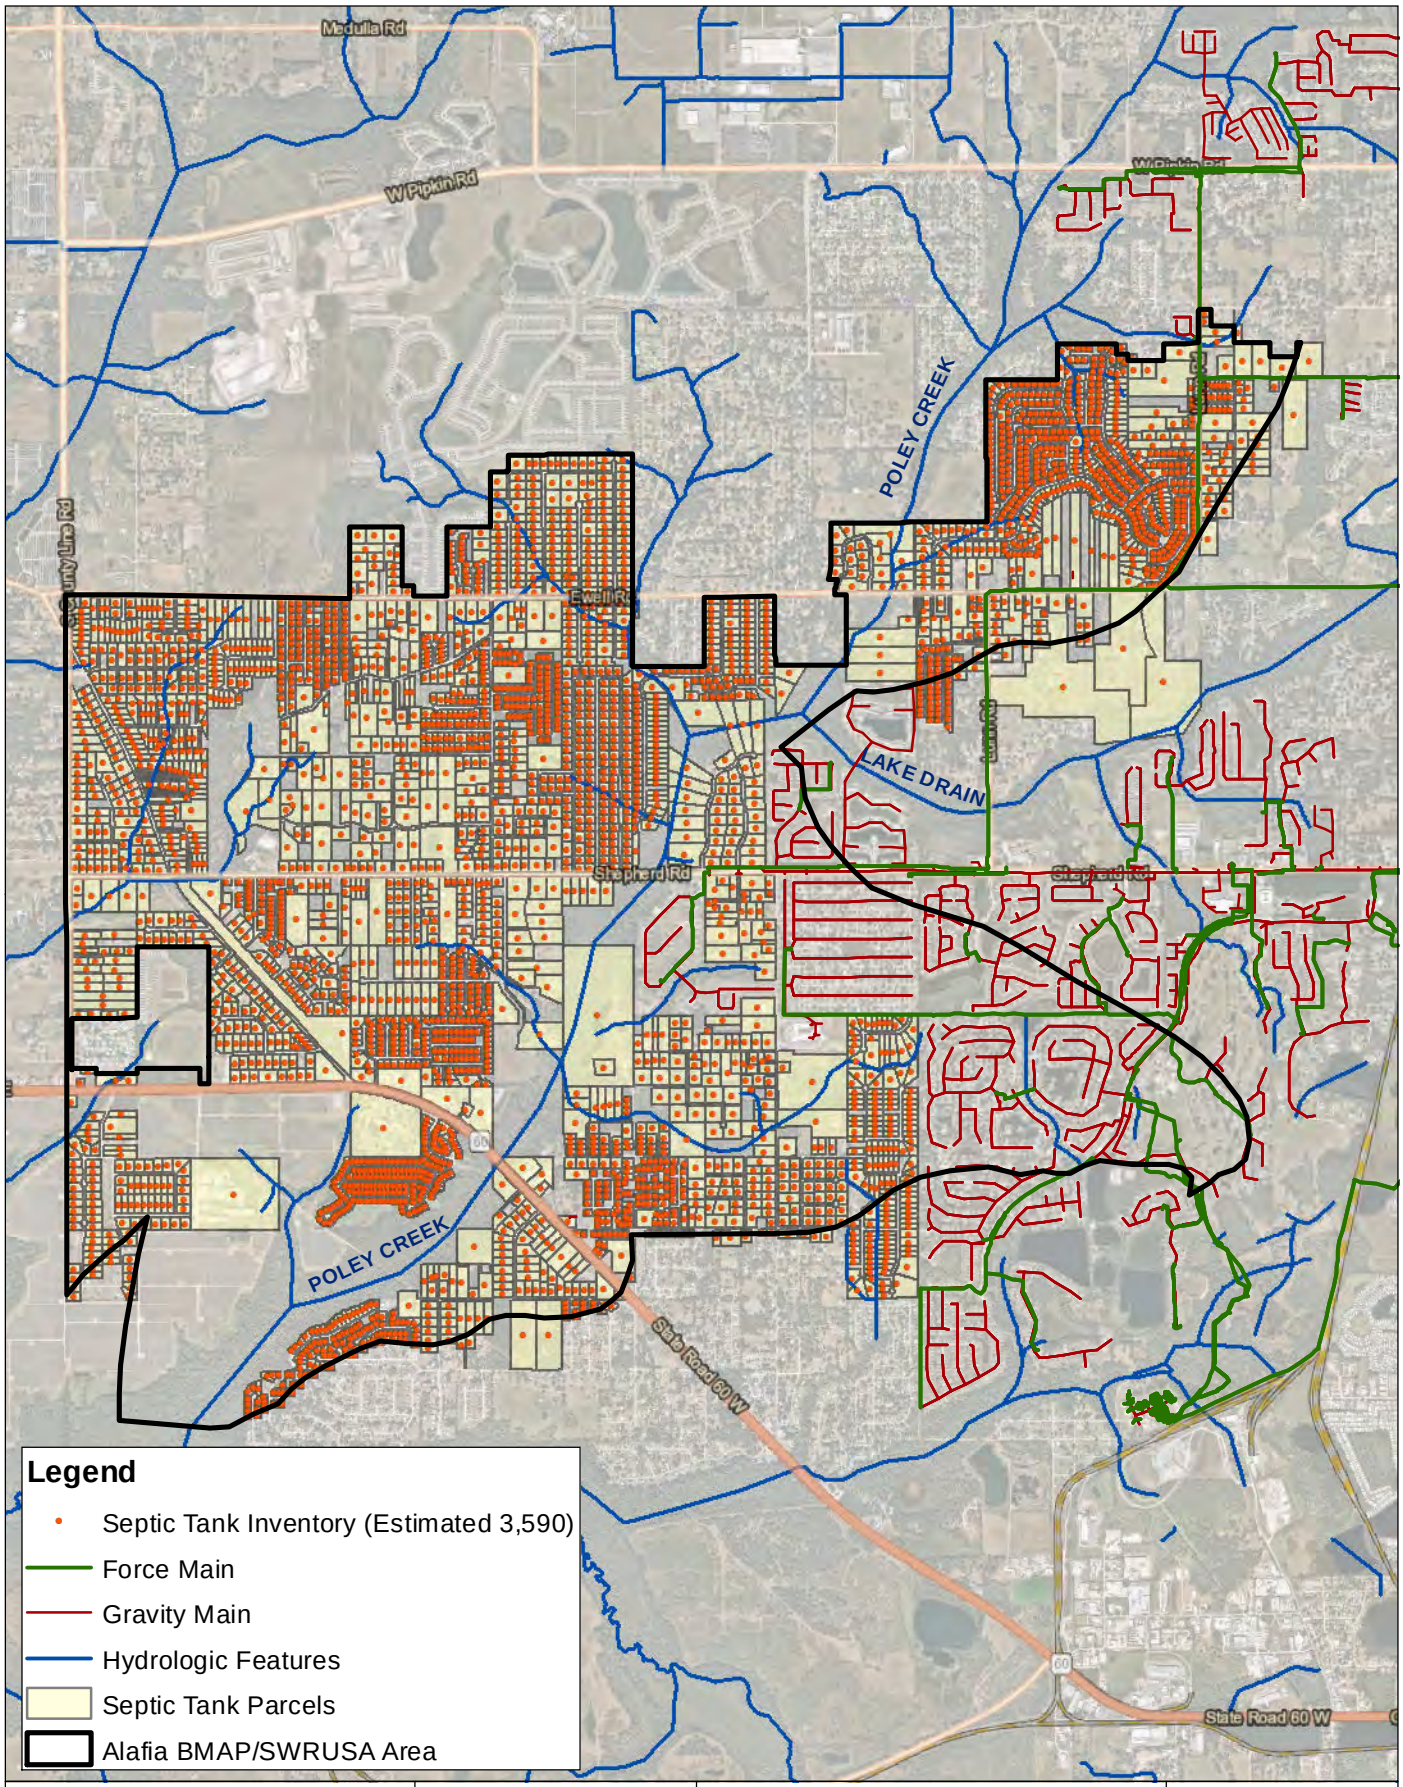

4. Inventory of Existing Septic Tanks in BMAP Areas

4.1 Septic Tanks in the Alafia River Watershed

To determine the number of septic tanks in the Alafia River Watershed portion of the SWRUSA, the analysis included the use of FDOH's Florida Water Management Inventory (FLWMI) GIS point and parcel polygon layers provided by the County to identify areas with "known septic tanks" or "likely septic tanks." Inventories of septic tanks for each of the areas are provided in **Appendix B**. Because the FDOH layers are somewhat dated (2018). This information was then compared to more recent County wastewater force and gravity mains infrastructure data and aerial imagery. This resulted in area refinement with some areas previously identified as "likely septic" converted to "likely sewer." County billing data was then used to determine whether homeowners in these areas were connected to the County's sewer system, and finally, maps were revised accordingly. Based on GIS analysis of the revised map (**Figure 4-1A**) there are approximately 3,590 septic tanks in the SWRUSA of the Alafia River Watershed. The included heat map (**Figure 4-1B**) helps visualize the density of the number of Septic Tanks in this area.

4.2 Septic Tanks in the Lake Okeechobee Watershed

The same approach as described for the Alafia River Watershed was used to determine the number of septic tanks in the Lake Okeechobee Watershed within the NERUSA, ERUSA and SERUSA. Based on GIS analysis of the revised map (**Figures 4-2, 4-3, and 4-4**), there are approximately 2,379 septic tanks in the NERUSA, 1,922 septic tanks in the ERUSA, and 1,710 septic tanks in the SERUSA.

4.3 Septic Tanks in the Upper Ocklawaha BMAPs Watershed

The same approach was used to determine the number of septic tanks in the Upper Ocklawaha Watershed portion of the NERUSA. Based on GIS analysis of the revised map (**Figure 4-5** above), there are approximately 334 septic tanks in this area of the NERUSA.

5. Estimated Future Growth of Septic Tanks Over Next Twenty Years

5.1 Source of Future Growth Estimates for Polk County

The source of future growth information available for Polk County was the current "Future Projects" GIS layer that provides the status of development projects within the County that are under review by County Planning staff and require approval by the County Commission. Status types included in the layer include In Review (IR), Level Two Application (LTAPP), Under Construction (UC), Activated (ACT), Board Accepted (BA), and the planning horizon can range up to five years or more for larger projects.

The County acknowledges that the June 12, 2023 Final Order requested 20-year future growth projections for septic tanks. However, the County concluded that simply extrapolating recent growth information out 20 years would not be accurate enough to make meaningful projections related to new septic tanks and septic to sewer connections.

5.2 Number of New Septic Tanks in Areas Not Currently Served by Central Sewer

5.2.1 Projected Number of New Septic Tanks in the Alafia River Watershed

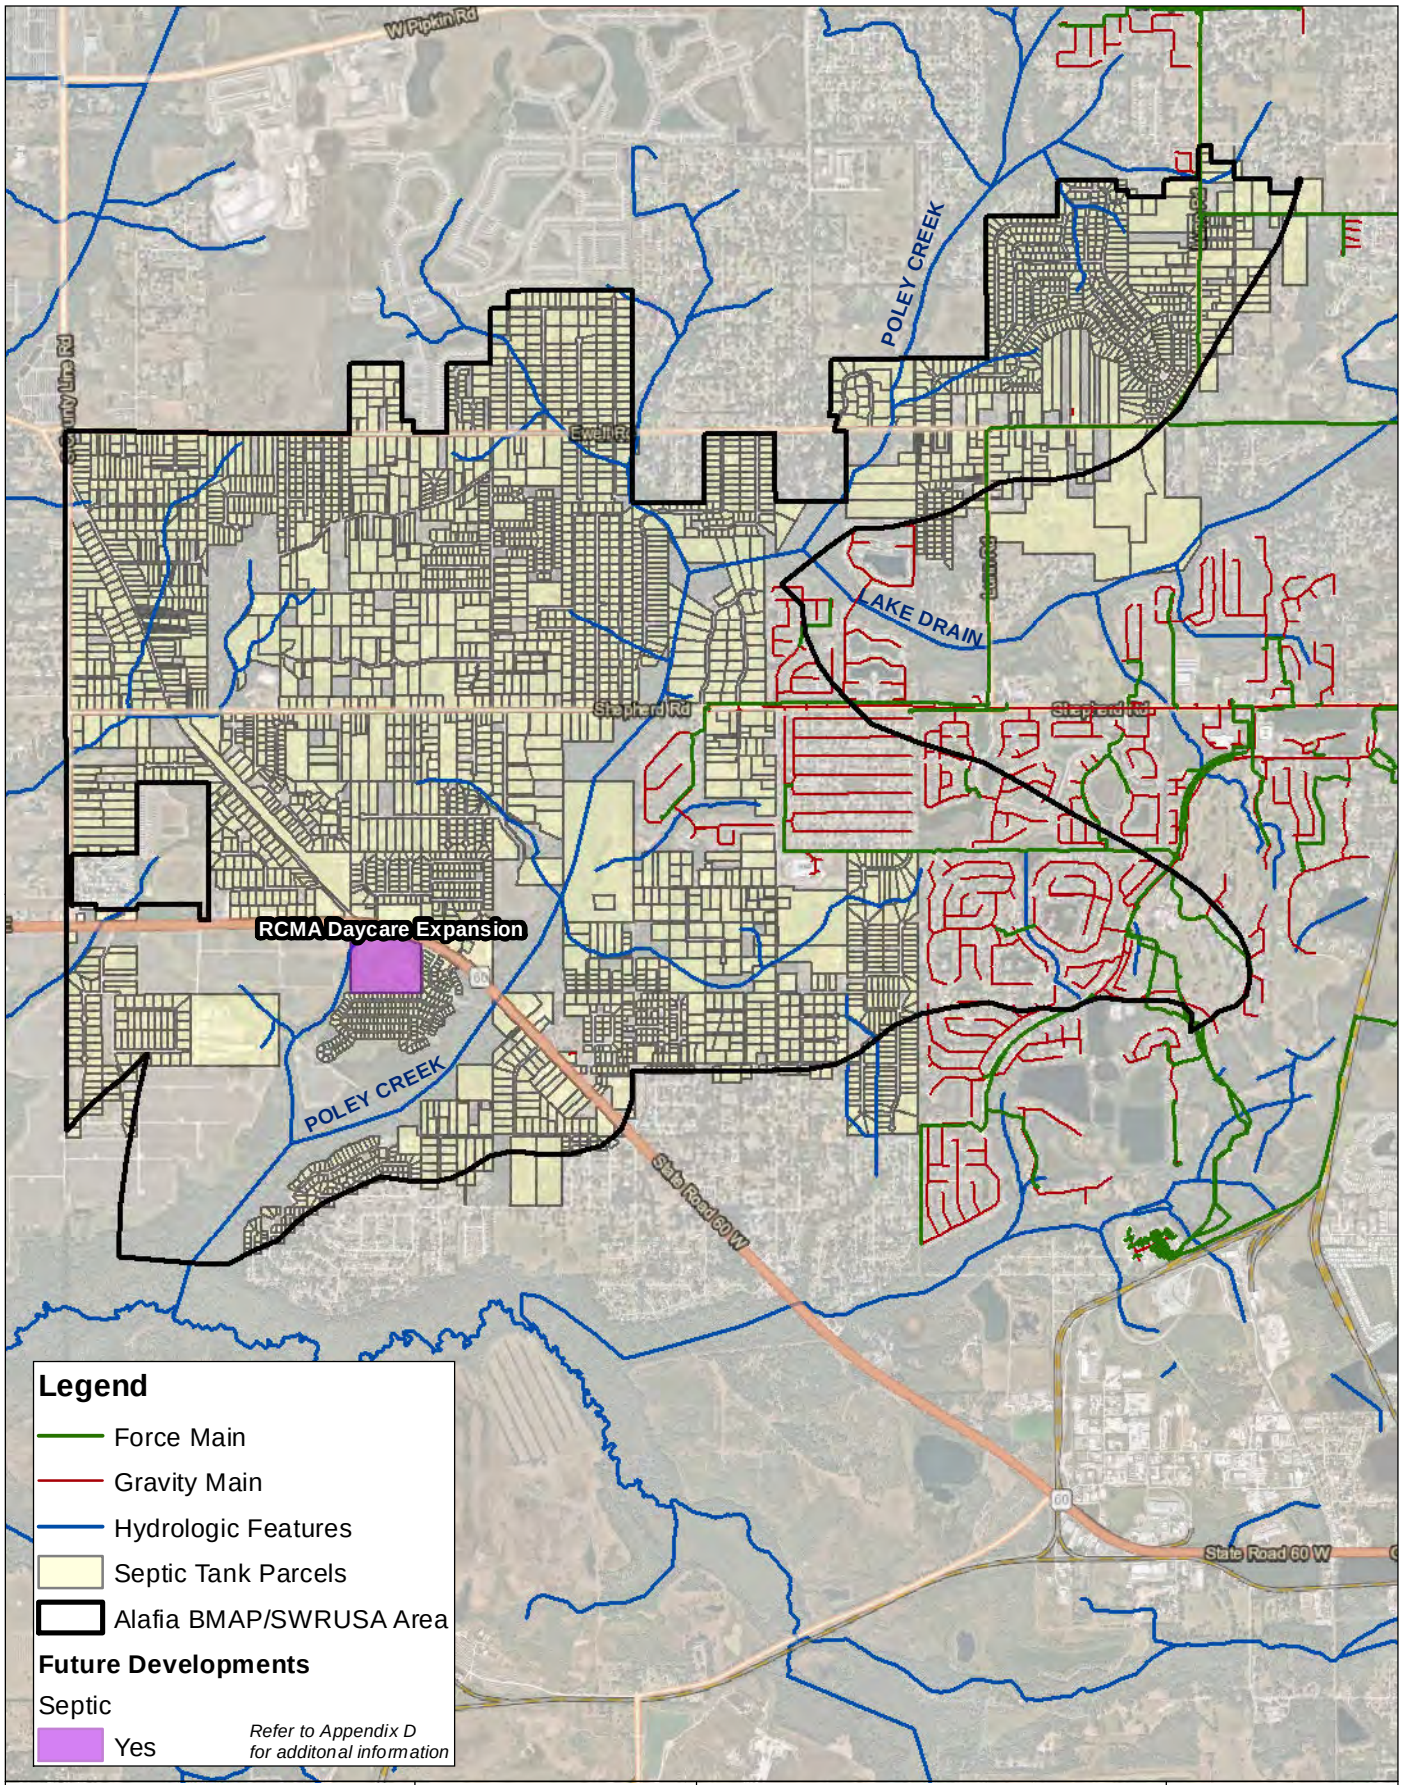

SWRUSA: The Alafia watershed within the SWRUSA is already highly developed and little new growth is expected in the area (**Figure 5-1**). Known ongoing or planned development within the area served by septic tanks is limited to one planned daycare expansion project with one new septic tank expected in the area.

5.2.2 Projected Number of New Septic Tanks in the Lake Okeechobee Watershed

NERUSA: There is significantly more development within the Lake Okeechobee watershed within the NERUSA, with 68 ongoing or planned projects (**Figures 5-2 and 5-3**). However, all projects will be served by centralized sewers rather than septic tanks.
ERUSA: There are two additional projects in the ERUSA (Timberlane Estates and Masterpiece Estates) and both projects will utilize septic systems (**Figure 5-4**). This will result in the installation of approximately 157 new septic tanks.
SERUSA: There is one ongoing or planned project in the SERUSA (**Figure 5-4**), however, the planned project does not appear to construct any new units; it is an extension of potable water mains.

5.2.3 Projected Number of New Septic Tanks in the Upper Ocklawaha Watershed

NERUSA: There is also significant development occurring within the Upper Ocklawaha watershed within the NERUSA, with 52 ongoing or planned projects (**Figure 5-5**). However, like the Lake Okeechobee watershed, the vast majority of the new development will be served by centralized sewers. The lone exception is a commercial development for the Davenport Self Storage facility, and there are is one new septic tank expected for that facility.

6. Estimate of Number of Septic Tanks to Be Eliminated Over Next Twenty Years Through Connection to Central Sewer

The evaluation for the number of septic tanks to be eliminated though a connection to central sewer included a review of the County's pro-active ordinance related to new residential development and septic tanks. Because the ordinance requires new developments to connect to centralized sewer, new septic tank installations were minimized. Development areas with existing septic tanks do not have centralized sewer service available. However, the County is studying areas that could become candidates for future septic to sewer conversion (see next section). To be able to plan for such future connections, the County would require State or Federal funding. Until the funding is secured, the potential number of connections over the 20-year period cannot be projected.

7. Prioritization of New or Extended Central Sewer Line and Connection of Septic Tanks

Polk County concurs that septic systems that are not properly maintained can be a significant source of nutrients in impaired waters based on their proximity to surface waters, soil characteristics, age of systems and other factors. The County is also identifying and evaluating opportunities to convert septic tanks to centralized wastewater treatment. However, the County had concluded that it is difficult to develop detailed deadlines and milestones for the planning, design and construction of new or extended central sewers at this time. There are many complicating factors including but not limited to the complexity and high costs involved in septic to sewer conversions, the limited time for plan preparation, the lack of known funding sources, the limited information from the Health Department on the location and age of septic systems, and the Department not providing specific nutrient reduction targets for septic tanks. As such, this section provides information about the County's efforts to evaluate potential areas for further evaluation for conversion from septic to sewer based on pending funding from the State and the success of a pilot project being considered by the Board of County Commissioners. The plan will provide as much detail as possible on the scheduled evaluation of these areas, but the County would like to emphasize actual construction of new sewer lines in these areas is contingent on the County receiving funding.

To prioritize areas for further evaluation as candidates for conversion of septic tanks to central sewer, the County used the following criteria: proximity to an Impaired Water Body or Outstanding Florida Water, density (homes per acre), age of septic system, hydrologic soil group, number of houses, and proximity to existing wastewater infrastructure.

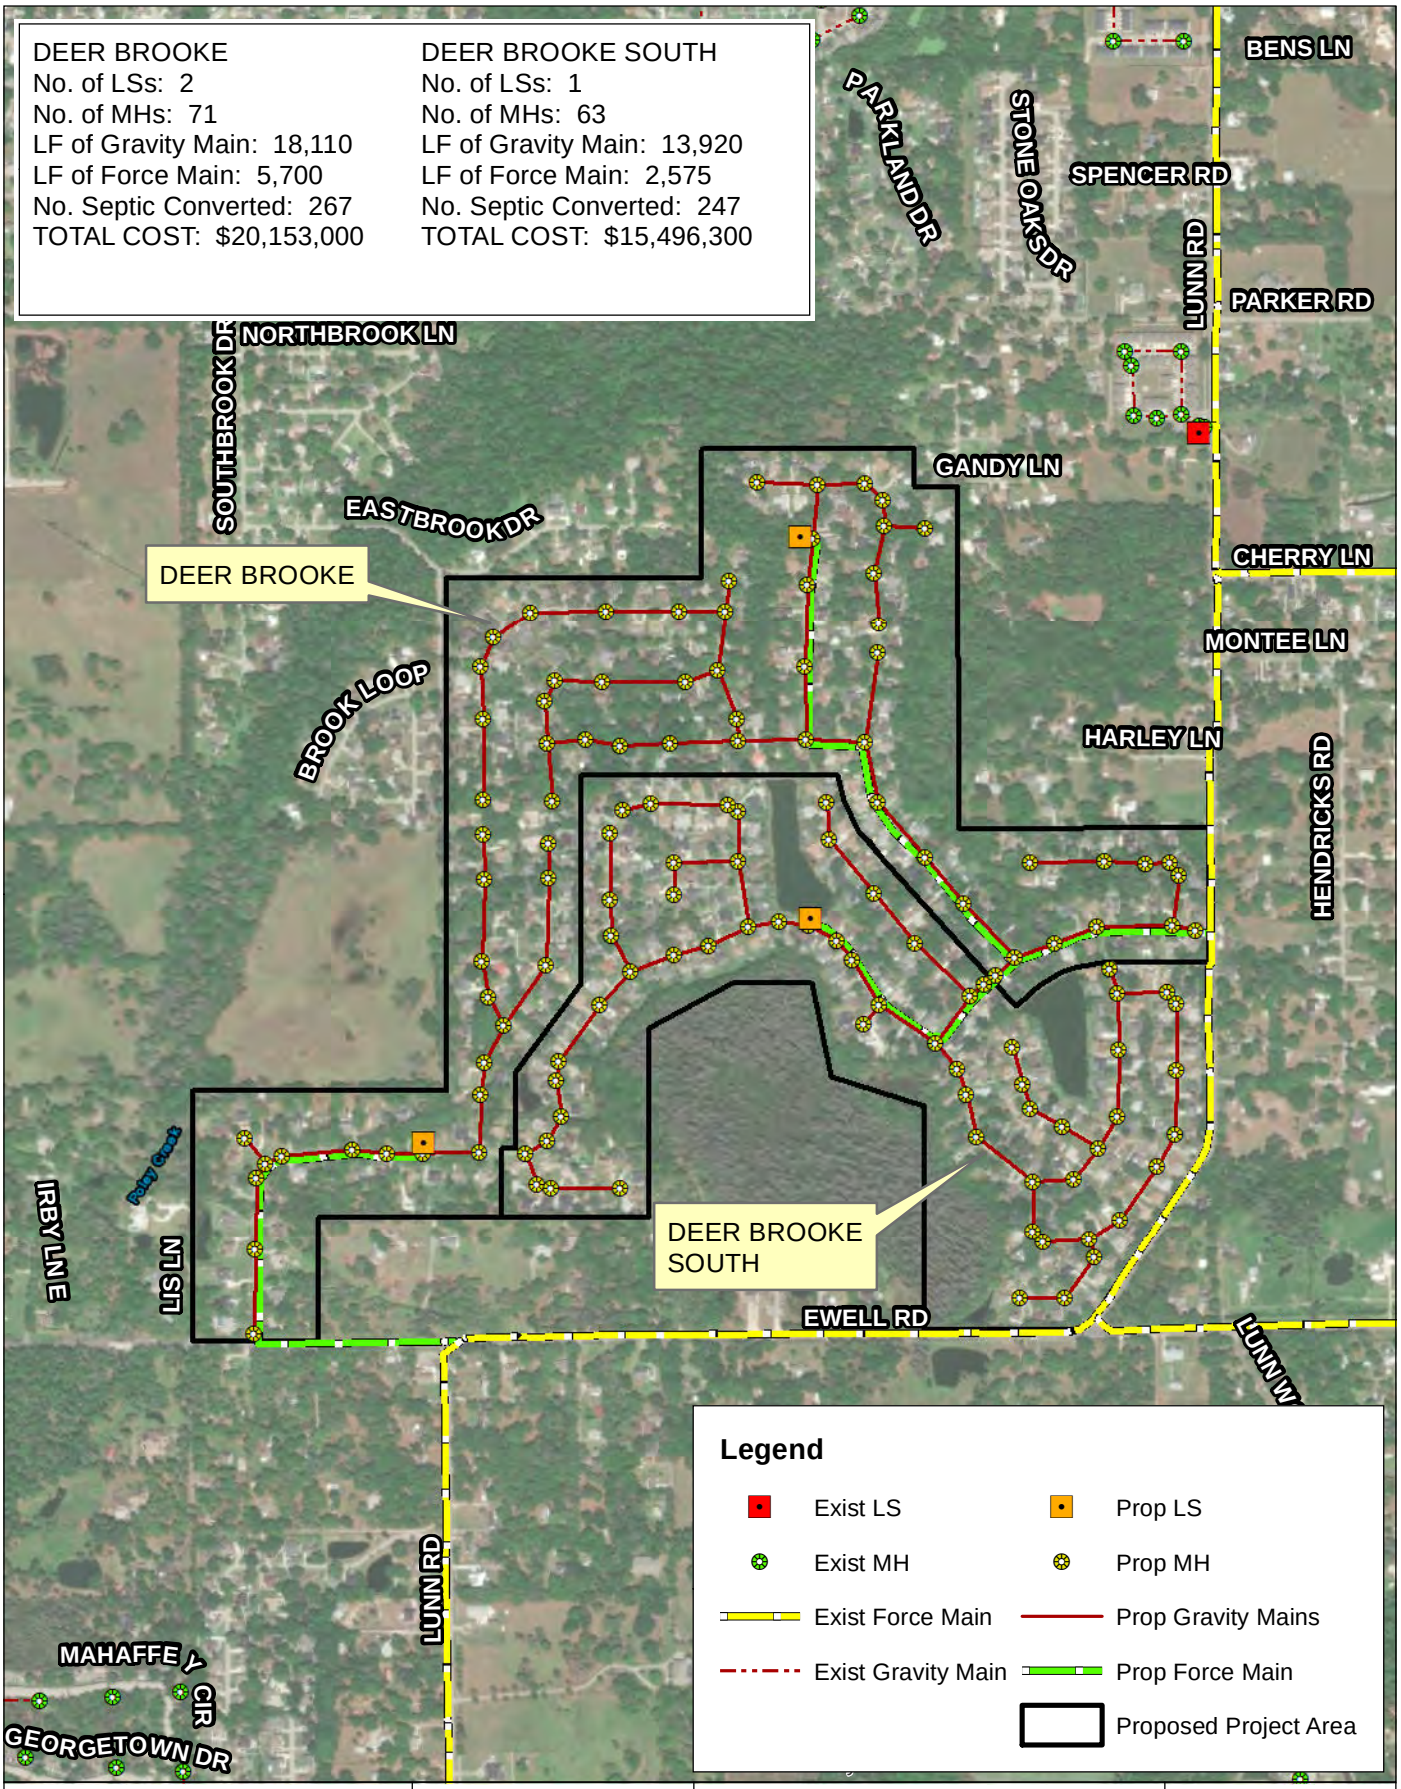

7.1 Plans for New or Extended Central Sewers in the Alafia River Watershed

A GIS analysis was performed to identify areas within PCUs SWRUSA and the Alafia River BMAP boundary that are being served by septic systems and are candidates for further study for septic to sewer conversion. The analysis identified an initial project list of candidate areas, each of which were then ranked. The ranking criteria used to prioritize the potential project list were the same as described above but the evaluation was limited to locations on the east side of Poley Creek.

The top three ranked locations, Deer Brook, Deer Brook South and Pineview Estates were selected for conceptual analysis of the infrastructure needed to connect the areas to the nearest central sewer. The sewer upgrades at the three selected locations include lift station installations, force main installations and extensions, gravity sewer installations, and all associated roadway repairs. The associated improvements, including estimated construction costs, are presented in **Figures 7-1** and **7-2**.

The total estimated costs for construction of these three projects approaches $40 million with an additional cost of approximately $2.5 million for homeowners to connect to the new sewers. These projects would result in the conversion of 587 septic tanks to sewer with an average price per septic tank of over $70,000. Given these high costs, the County is not able to commit to implement these or

similar projects without State and/or Federal funding. However, the County plans to request additional funding to further explore the wide array of policy issues, stakeholder outreach requirements, and funding requirements to design, plan, and construct sewer lines to convert these two areas to centralized sewer. While the County does have local ordinances that require homeowners to connect to central sewer within a year of becoming available, the County has no prior history with septic to sewer conversions. Time and a great deal of effort will be needed to explore the more detailed policies needed to govern this process, including how to handle the extensive stakeholder outreach needed to successfully navigate a septic to sewer conversion.

7.2 Plans for New or Extended Central Sewers in the Lake Okeechobee Watershed

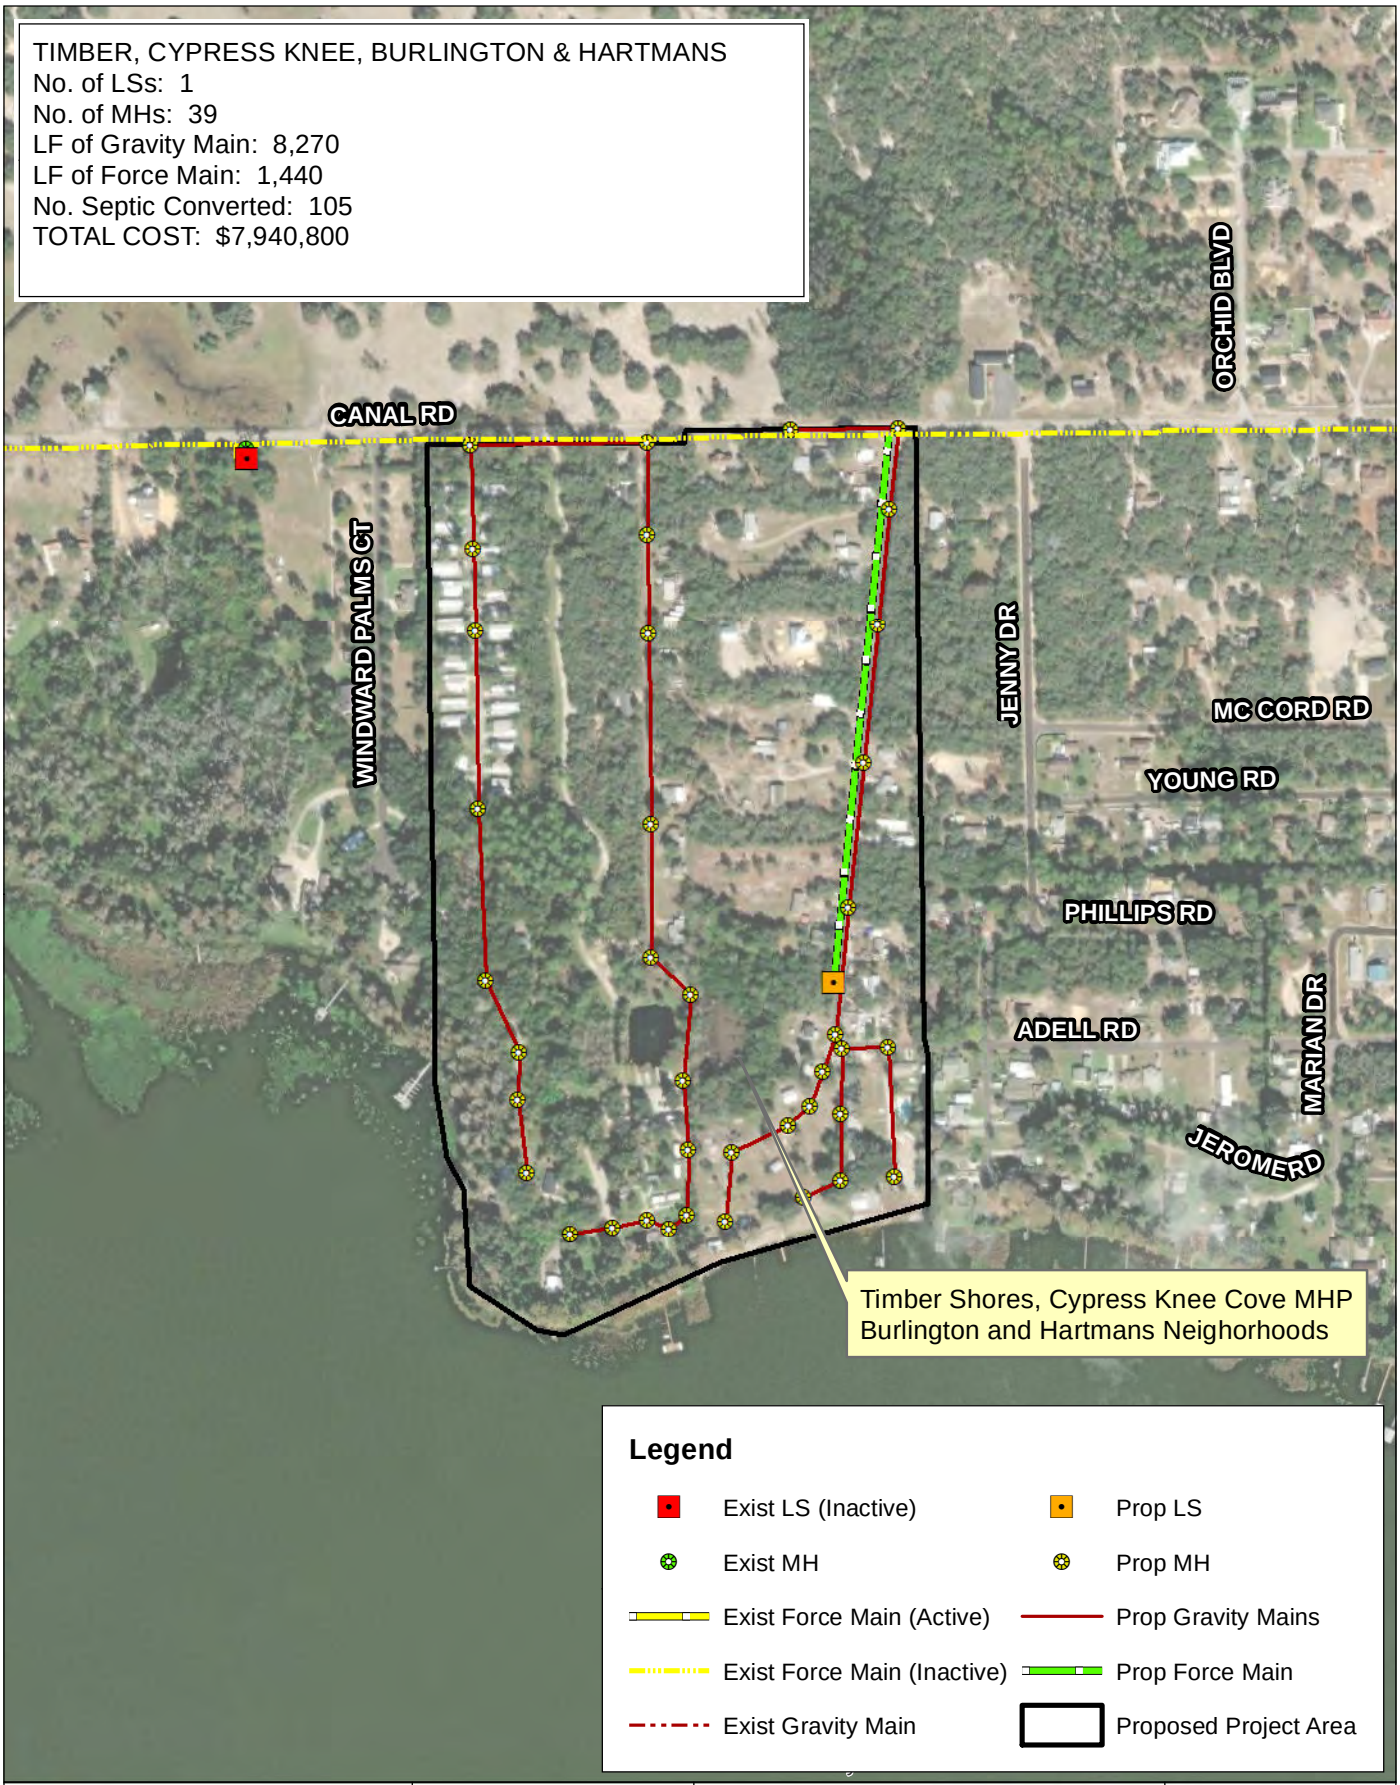

Prior to the Department's June 12, 2023 Final Order, the County proactively conducted an initial evaluation of candidates for septic to sewer conversion within the Kissimmee River Basin (see **Appendix C**). For the evaluation, 93 potential project locations were identified within the County's service areas in the Kissimmee River basin, and then ranking criteria was developed to prioritize the potential project list. The ranking criteria included proximity to an impaired water body or Outstanding Florida Water, density (homes per acre), age of septic system, hydrologic soil group, number of houses, and proximity to existing wastewater infrastructure.

Based on the ranking results, the top five projects were identified and an Engineer's Opinion of Probable Construction Costs (EOPCC) was calculated for each project. the Upper Kissimmee River Watershed WAM model was then used to evaluate the five projects to estimate the annual nitrogen load reductions expected from each. With the estimated cost per pound of nitrogen removed for each project calculated, the County selected the top two most cost-effective projects for further evaluation (**Table 7-1**). Preliminary layouts for these two projects are shown in **Figures 7-3** (Timber Shores) and **7-4** (Crooked Lake Park Tracts 1 & 2).

The County would like to emphasize the project costs for the top two projects total nearly $17 million and the estimates do not include all potential costs including construction of a gravity sewer in an un-defined right-a-way for the Timber Shores project. As noted for the top candidates in the Alafia Basin, the County plans to further explore what would be needed to convert these two areas to centralized sewer. However, in 2023 the County submitted a request for State funding for these project areas and the request was not approved. The County cannot commit to exploring the many policy elements needed to convert neighborhoods from septic to centralized sewer, as articulated for the Alafia River Basin, unless external funding is made available for identified locations.

Table 7-1: Summary of Costs and TN Removal Efficiency for the Two Highest Ranked Projects

SUMMARY COST PER PROJECT				
FINAL RANK	PROJECT NAME	TOTAL ESTIMATED COST	TN REDUCTION (LBS/YR)	COST PER POUND TN REMOVED
1	Timber Shores, Cypress Knee Cove MHP, Burlington & Hartmans Subdivisions	$7,940,800	1,449	$5,480
2	Crooked Lake Park Tracts 1 & 2, and South Lake Wales Yacht Club [to Crooked Lakes Sewage WWTF]	$8,941,900	1,341	$6,670

7.3 Plans for New or Extended Central Sewers in the Upper Ocklawaha Watershed

Based on the County's prioritization criteria for identifying areas for conversion from septic tanks to central sewer, the County does not plan to extend or construct new central sewers within the portions of the NERUSA within the Upper Ocklawaha Basin. This is consistent with the Upper Ocklawaha BMAP, which specifically states that septic tanks were not addressed in the BMAP because they represent a relatively small percentage of pollutant loading within the basin. The BMAP also acknowledges that a) Polk County is not heavily developed in the area discharging to the Upper Ocklawaha, b) future development is largely restricted as part of the Green Swamp Area of Critical State Concern (ACSC), and c) development in the remaining acreage will be served by central sewer service. The Green Swamp ACSC has been established by the County as a "Special Protection Area" in its Comprehensive Plan and land development code, both of which provide specific limitations on the use of septic tanks in the Green Swamp ACSC, including mandatory inspection of septic tanks by a registered OSTDS inspector every five years.

8. Estimated Costs of Upgrades to Enhanced Nutrient-Reducing Septic Tanks

8.1 Number of Septic Tanks that Require Upgrades

Based on the evaluation of future growth in the three service areas that overlap with the Alafia River, Ocklawaha, and Lake Okeechobee BMAP watersheds, there are a total of 158 new septic tanks expected to be constructed in Polk County service areas that will not be served by central sewer within five years of construction. Some of these septic tanks **may** be required to be "enhanced nutrient-reducing" septic tanks. However, revised section 403.067(a)10., F.S. may "grandfather" developments that have already been approved by the County or have submitted complete applications for review.

8.2 Estimated Costs of Upgrades

Homeowners have the option to select from one of three types of enhanced nutrient-reducing septic tanks: Aerobic Treatment Units (ATU), Performance-Based Treatment Systems (PBTS), and In-ground Nitrogen Reducing Biofilter Systems (INRBs). Assuming the unlikely event that all 158 of the new septic tanks were required to be upgraded and given the average total costs[1] for each type of system, $34,220 for ATU, $39,258 for PBTS, and $14,526 for INRB, potential costs could range between $2,295,108 (if all were INRBs) and $6,202,764 (if all were PBTS).

9. Other Cost-effective and Financially Feasible Projects Necessary to Achieve Nutrient Load Reductions For Septic Tanks to Meet BMAP Water Quality Objectives

Based on review of the three BMAPs in the County's service areas, the County has concluded that there are no septic tank related projects that are necessary to meet water quality objectives in the three BMAPs that overlap county service areas. However, the County acknowledges that septic tanks are potentially a significant source of nutrients to its surface waters, and as such, the County plans to continue to work on a variety of items related to septic tanks, including:

- Continuing land acquisition efforts and conserving land which might have otherwise been developed with septic tanks.
- Piloting the use of "OnSyte" distributed wastewater technology to replace OSTDS at two locations within the County (at a fire station and a school). The OnSyte system, which will exceed the nitrogen removal requirements for PBTS, replaces the septic tank with an advanced nutrient-removal wastewater treatment process that uses a suspended-growth, activated-sludge process in a miniaturized Sequencing Batch Reactor (SBR). Once treated, the clean water is directed to a drainfield. These systems cost approximately $25,000, which is significantly less

[1] Tetra Tech, Comprehensive *Wastewater Treatment Plan, Task 2: Cost-Effectiveness of Alternative Technologies*," February 2021, prepared for Leon County, FL.

expensive than ATU and PBTS. Further, they have the advantage of being actively managed by a third party, rather than being the responsibility of the homeowner.

- Exploring a funding program to assist homeowners with connections to central sewer and to assist with cost of conversion to an enhanced system.
- Amending the Comp Plan and Land Development code to address septic tanks.

Subject: [EXTERNAL]: Toho Water Authority Wastewater Treatment Plan for House Bill 1379

Good evening,

My name is Brian Megic with Liquid Solutions Group, LLC. We are an engineering consulting firm assisting Toho Water Authority (Toho) with tasks related to the Lake Okeechobee Basin Management Action Plan (BMAP).

On June 12, 2023 a Final Order regarding Office of General Counsel (OGC) Case No. 23-0112 to 0135 – Determination Regarding Necessity of Wastewater Treatment Plans and Onsite Sewage Treatment and Disposal System Remediation Plans for Certain Nutrient Basin Management Action Plans was executed by the Florida Department of Environmental Protection (FDEP). The Final Order references subparagraph 403.067(7)(a)9., Florida Statutes (F.S.), which specifies that local governments within certain BMAP areas must develop a wastewater treatment plan containing specific information as listed in the Final Order. The Lake Okeechobee BMAP area (23-0119) is listed in the Final Order as requiring the submittal of wastewater treatment plans by local governments.

Toho is a regional water, wastewater, and reclaimed water utility provider for an area that includes the City of Kissimmee, the City of St. Cloud, and portions of Osceola, Orange, and Polk Counties. Toho's wastewater and reclaimed water systems are predominately located within the Lake Okeechobee BMAP area. As such, Osceola County requested that Toho provide information related to Toho's water reclamation facilities and reuse systems for them to submit to the FDEP in compliance with the Final Order. However, two of Toho's water reclamation facilities and associated reuse systems are located within the portion of the Poinciana area located in Polk County. The purpose of this memorandum is to summarize the plans Toho has developed to meet the BMAP and this memorandum is being provided to both Osceola and Polk Counties. This memo can be included as part of the submittal Polk County is provided in response to the Final Order.

If you have any questions or comments on the attached, please let us know. We can provide a final version in pdf before the February 1, 2024 deadline for the draft plan.

Thanks,

Brian

Appendix

Appendix A: Septic to Sewer Evaluation for Polk County using the Watershed Assessment Model

Appendix B: Conceptual Level EOPCC

1. Introduction and Background

Water quality degradation continues to increase throughout Florida and impact the lakes and rivers in our local communities. Recently, the Polk County Parks and Natural Resources Division (PCPNR) completed an update of the Florida Department of Environmental Protection (FDEP) Watershed Assessment Model (WAM) for the Upper Kissimmee River Watershed (UKRW) that provided Polk County important information on lakes and other impaired water systems in the UKRW.

As population increases in Polk County, land which was previously categorized as agricultural or undeveloped, has been or is planning to be, converted to residential use. Over the years, many of these rural areas are outside of traditional utility service areas and have been served by septic tank systems. Upon review of the vast area of Polk County, there are several lakes or river systems that have high levels of nitrogen and/or phosphorus. Septic systems are not the only source of these nutrients in these impaired water bodies, but based on proximity to surface waters, soil characteristics, age of systems and other factors they could be a major contributing source.

Polk County Utilities (PCU), in collaboration with PCPNR, would like to identify and evaluate opportunities in the Kissimmee River Basin to convert septic tank systems to centralized or advanced treatment systems to improve water quality. Tools developed in the FDEP WAM update, along with other sources of information, will be used to evaluate and prioritize areas for conversion as well as identify infrastructure opportunities and environmental benefits. A septic to sewer pilot project will then be selected from these evaluations, modeling analyses, and recommendations.

2. Project Development

Dewberry performed GIS analyses to identify areas that are being served by septic systems, including mobile home park/RV resorts on package plant treatment. The initial potential project list was comprised of 93 potential project locations in four (4) main geographic areas: NERUSA (37), ERUSA [Lake Pierce] (38), Crooked Lake (3), and SERUSA/Sun Ray [Lake Clinch] (15). Dewberry developed project ranking criteria, in consultation with PCU staff, to prioritize the potential project list. Ranking criterion included proximity to an Impaired Water Body or Outstanding Florida Water, density (homes per acre), age of septic system, hydrologic soil group, number of houses, and proximity to existing wastewater infrastructure. The top ten (10) ranked projects were presented to PCU in two workshops and the top five (5) project locations were selected for conceptual analysis.

3. Summary of Proposed Sewer Upgrades

This section summarizes the proposed preliminary upgrades at each of the five (5) identified areas for conceptual analysis. The sewer upgrades at the selected locations include decommissioning of wastewater package plants, lift station installations, force main installations and extensions, gravity sewer installations and all associated roadway repairs. Upon completion of the sewer improvements, the collected wastewater flows are directed and treated at an advanced wastewater treatment facility, in lieu of the current septic or package plant treatment.

3.1 Area 1: Jennings Resort Fish Camp

This area consists of an existing mobile home park (MHP) located on the northwestern bank of Lake Pierce. The current collection system is understood to be either a gravity or low-pressure force main system, or combination of both, that collects and conveys wastewater flows to the Jennings Resort wastewater treatment facility (WWTF). The Jennings Resort WWTF is a package WWTF permitted by the FDEP (permit number FLA011052) for 0.012 million gallons per day (MGD) at a three-month average daily flow (3MADF).

It is anticipated that no revisions to the current collection and conveyance system within the Jennings Resort area will be required. As part of the upgrades for this location, a new PCU owned and operated lift station will be constructed that meets the current standards set forth by PCU's Utility Standards and Specifications Manual. The existing WWTF sits on a property large enough that the new lift station can be constructed on the same property as the existing WWTF. With acquisition of a permanent utility easement, a new force main can be routed from the new lift station west through the property owned by

Jennings Resort. This route provides the least amount of disruption to the existing residents of the MHP. The new force main will tie into the existing active force main located along Canal Road. Once the new lift station and associated force main are constructed, tested, and substantially complete, the existing WWTF can be decommissioned, demolished and restored to conditions as requested by PCU. See **Figure 1** for the proposed sewer improvements. During detailed design, a hydraulic analysis shall be performed to assess the potential impacts to any existing lift stations.

3.2 Area 2: Whispering Pines MHP, Lakemont Ridge Home and RV Park, and Lakefront Trailer Park

The Whispering Pines MHP, Lakemont Ridge Home and RV Park, and Lakefront MHP are located on the southwestern portion of Lake Clinch and consist of mainly mobile homes and community centers. There are three (3) active existing package WWTFs permitted with FDEP that serve each respective community. It is understood that the current collection system(s) are either gravity and/or low-pressure force main system(s) that collect and convey wastewater flows to FDEP permitted package WWTF's ranging from 0.01 MGD to 0.03 MGD permitted capacity at 3MADF conditions. The FDEP permit numbers are: Lakefront Trailer Park (FLA012995), Lakemont Ridge Home & RV Park (FLA012998), and Whispering Pines MHP (FLA013005).

Due to the density of the mobile home parks in this area, it is anticipated that no significant revisions to the existing collection and transmission system(s) will take place. As described above in Area 1, the three (3) existing package WWTF's located within Area 2 will be taken offline and decommissioned after the installation and testing of three (3) new lift stations meeting PCU standard requirements. It is assumed that each existing WWTF parcel has adequate land to install a new lift station onsite, while maintaining operation of the WWTF, until each new lift station is operational. Each new lift station will have an appropriately sized force main, to convey peak flows, that ties into an existing force main along Fort Meade Road. Conceptual design assumes that each new lift station will serve the existing number of residents in each community and will not see increased flows to the station; no future buildout plan has been evaluated for each of these locations. **Figure 2** shows the proposed sewer improvements for Area 2. During detailed design, a hydraulic analysis shall be performed to assess the potential impacts to any existing lift stations; specifically downstream re-pump station WWCS6001 (LILY LAKE GOLF AND RV RESORT PHASE 4A).

3.3 Area 3: Crooked Lake Park Tracts 1 & 2, and South Lake Wales Yacht Club

The area known as Crooked Lake Park was recently taken over by PCU as receivership. This area is located on the western side of Crooked Lake and consists of septic tanks, gravity flow sewer, lift stations, and a package WWTF. PCU currently has two (2) projects in this area, one in the design phase and one in the bid phase, to improve the sanitary sewer infrastructure in adjacent portions of the subdivision. One project is to reduce inflow and infiltration in the existing collection system and the other project entails lift station and force main improvements. The lift station and force main improvement project will ultimately divert flows to the City of Lake Wales WWTF and decommission the Crooked Lake Park Sewerage Company WWTF (FLA013038).

There are portions of Crooked Lake tracts 1 and 2, as well as South Lake Wales Yacht club, where there is no existing sanitary collection system, and therefore, there is an opportunity to extend the wastewater collection system and eliminate the existing septic tanks. It is proposed that portions of this area have gravity sewer installed to the current PCU standards, which includes the installation of manholes, gravity sewer pipes, laterals, force mains, and a lift station to ultimately connect this system to the proposed master LS374. It is anticipated that a lateral connection shall be provided to each existing customer and vacant lot. Septic tank abandonment procedures have been outlined by the Florida Administrative Code (FAC) 62-6.011 under the Abandonment of Systems section. This procedure includes the pumping out of sewage and sludge in the existing septic tank, disposal per local and agency requirements, disposal of the septic tank lid, and punching a hole in the base of the structure to prevent holding water. The tank is then filled with sand material and abandoned. For existing customers, once the gravity and transmission systems are online and cleared by regulating agencies, a certified plumber disconnects the home lateral from the septic tank and ties it into the newly installed lateral to the right-of-way. Conceptual level layouts for this area can be found in **Figure 3**.

As part of gravity sewer installation projects of this magnitude, where gravity sewer is constructed down the center of the roadway, it typically requires a complete restoration of the roadway within the project area. It also presents an opportunity for other utility owners such at fiber, cable, electric, water, to upgrade their facilities. It should be noted that projects of this type are highly invasive to the residents for an extended period of time, however with detailed construction plans and specifications there are opportunities to mitigate such intrusions on the local residents.

3.4 Area 4: Bay View Park Subdivision

Bay View Park subdivision is located adjacent to the Area 2 project on the southwestern side of Lake Clinch. This subdivision includes single family residential homes and mobile homes currently on septic tank systems. This project area is directly adjacent to Lake Clinch with several homes along the lake shore. There are no existing PCU or privately owned and managed sanitary sewer systems within this project boundary except for a PCU force main along Fort Meade Road.

The proposed improvements within Bay View Park include the installation of traditional gravity sewer collection system within the right-of-way that meet the current PCU standards. Bay View Park is also located directly adjacent to the Area 2 Lakefront MHP. Due to the small footprint of this area, it is proposed that the gravity sewer be conveyed to the proposed lift station shown in Area 2, at the intersection of Katie Lane and Fort Meade Road, presented in **Figure 2,** and therefore, making this project contingent on Area 2. The proposed lift station would allow the wastewater flow to be pumped directly into the existing force main along Fort Meade Road. Strict guidelines will be followed for proper septic tank abandonment per FAC 62-6.011 as previously described in Section 3.3. **Figure 4** provides a conceptual level layout for the proposed improvements in Bay View Park.

Proposed gravity sewer installed in the center of an existing roadway are highly invasive and typically require a complete restoration of the roadway within the project area. This presents an opportunity for other utility owners such at fiber, cable, electric, and/or water, to upgrade their facilities as previously mentioned in Section 3.3.

3.5 Area 5: Timber Shores, Cypress Knee Cove MHP, Burlington & Hartmans Subdivisions

Area 5 is a collection of four neighborhoods and a mobile home community along the northern shore of Lake Pierce; it is our understanding that these communities are served by septic systems. Several of the communities are privately owned with multiple residences on a single parcel, while Hartmans and Timber Shores appear to have individually owned parcels. On privately owned communities, negotiations for permanent or private easements will be required to provide PCU sanitary utilities within the area. These areas also provide challenges where the roads are narrow or have layouts inconsistent with County or FDOT requirements.

Due to the topographic features of this area and the general negative slope toward Lake Pierce, gravity sewer collection is the optimal collection type for this area. The preliminary layout shown in **Figure 5** includes a PCU standard gravity collection system and standard lift station. The collection system proposed will collect flows along Donaldson Drive, Capernaum Inn, Timber Shores Road, Hartman Road, and also collect flows from Oak Hammock Resort and Holiday Park. The proposed lift station location is an undeveloped lot between Hartman Road and Timber Shores. This project is contingent on PCU being able to acquire a lot within the project boundary that is feasible to gravity flow to the proposed lift station. The areas along the Lake Pierce shoreline are also within the flood zone AE, further limiting desirable locations for a lift station. From the proposed lift station location, a force main would be routed north along Hartman Road and tie into the existing force main on Canal Road utilizing a series of isolation valves to direct flow east. Currently the existing force main along Canal Road is inactive; this conceptual alternative would require roughly 3,200 LF of the inactive 8” force main to be inspected, tested and cleaned prior to being put into service. During detailed design, a hydraulic analysis shall be performed to assess the potential impacts to any existing downstream lift stations.

As noted previously, gravity sewer installation projects, where proposed gravity sewer is installed in the center of an existing roadway, are highly invasive, typically requiring a complete restoration of the roadway within the project area. It also presents an opportunity for other utility owners such at fiber, cable, electric, and/or water, to upgrade their facilities.

4. Water Quality Assessment

Soil and Water Engineering Technology, Inc. (SWET), a subcontractor to Dewberry, utilized the UKRW WAM model to evaluate the five (5) project locations selected for conceptual analysis. To evaluate these areas, the existing conditions scenario was altered by modifying either the land use (for communities utilizing septic systems) or by removing the inputs that simulate package plant discharge and redirecting it to larger centralized WWTFs that have the capability to provide advanced treatment. The estimated water and nutrient loading from the contributing area of the receiving water bodies in the project area in the existing conditions (pre) and after project implementation (post), as well as the reduction and percentage reduction were quantified. Estimated volume is given in average annual acre-feet (ac-ft/yr) and nutrient reductions are shown in average annual pounds per year (lbs/yr). A detailed report of the water quality analysis performed by SWET is provided as **Appendix A**.

5. Engineer's Opinion of Probable Construction Costs

Based on the above-described proposed improvements for each project area, an Engineer's Opinion of Probable Construction Costs (EOPCC) was developed. The basis for the EOPCC is a collection of recent project bids similar in both scope and size. Line items and specific unit costs have been consolidated to account for ancillary items as noted in each section header. The conceptual level EOPCC also includes a contingency of thirty percent (30%) applied to the subtotal and provides a total budgetary cost for each project. Utilizing the annual total nitrogen reduction identified in the Watershed Assessment Model (Appendix A), a cost per pound of nitrogen removed on an annual basis has been provided. Refer to **Appendix B** for the detailed conceptual level EOPCC. In addition to the nitrogen removal, the project areas are seeing phosphorous removal in the range of 0 to 43 lbs/yr.

Table 4-1 provides the final ranking, conceptual level cost estimates, total nitrogen removed per year, and the cost per pound of nitrogen removed for each project. Note that for project area 3, Crooked Lake Park, the total nitrogen removal was calculated for the septic to sewer conversion going to the Crooked Lake Park Sewerage Company package WWTF as well as the ultimate diversion of flows to the City of Lake Wales WWTF; the cost per pound of nitrogen removed was not calculated for the diversion of flows to the City of Lake Wales WWTF. Final ranks 3 and 4 were renamed as rank 3a and 3b since project area 4 cannot be done without the implementation of project area 2.

Table 4.1 Summary Cost per Project

	SUMMARY COST PER PROJECT				
FINAL RANK	PROJECT NAME	TOTAL ESTIMATED COST	TN REDUCTION (LBS/YR)	COST PER POUND TN REMOVED ($/LB-YR)	COST PER POUND TN REMOVED [EXCLUDNG SEPTIC ABANDONMENT COST] ($/LB-YR)
1	Area 5: Timber Shores, Cypress Knee Cove MHP, Burlington & Hartmans Subdivisions	$7,940,800	1,449	$5,480	$4,630
2	Area 3: Crooked Lake Park Tracts 1 & 2, and South Lake Wales Yacht Club [to Crooked Lakes Sewage WWTF]	$8,941,900	1,341	$6,670	$5,270
3a	Area 2: Whispering Pines MHP, Lakemont Ridge Home and RV Park, and Lakefront Trailer Park	$4,430,200	682	$6,500	$6,500
3b	Area 4: Bay View Park Subdivision **	$3,466,500	2,197	$1,580	$1,310
5	Area 1: Jennings Resort Fish Camp	$1,609,600	174	$9,250	$9,250

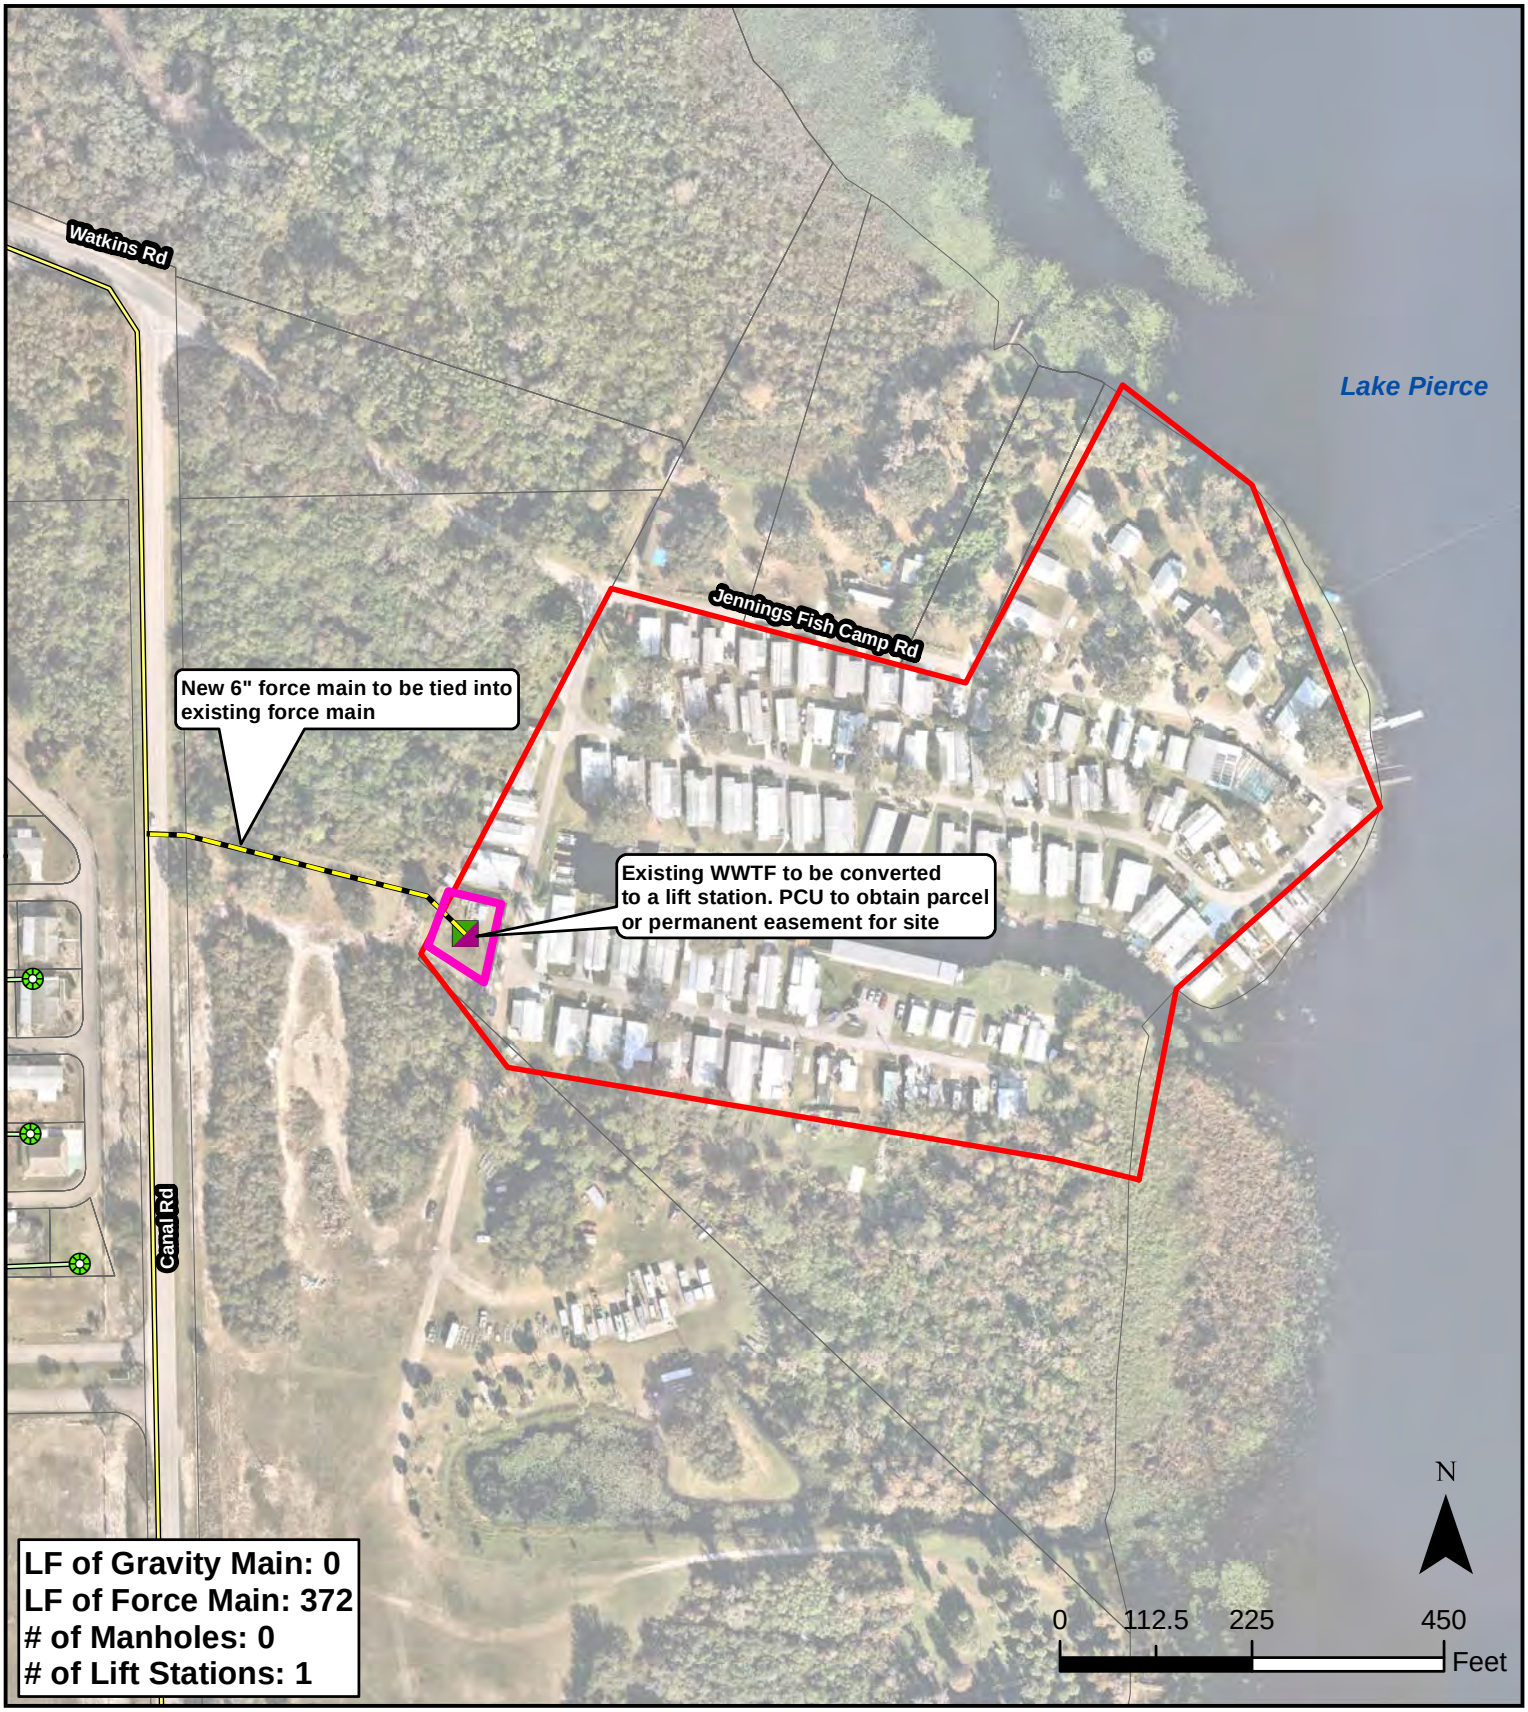

Notes:

**Improvements to Area 4 (Bay View Park Subdivision) do not include the costs of conversion for Area 2 WWTF located at Katie Lane to a PCU standard Lift Station. Those costs and improvements would need to be completed prior to the septic to sewer conversion before Area 4 can be placed online.

1. Preliminary costs do not include land acquisitions or easement costs.
2. Decommissioning of Package WWTF to be per FAC 62-620.610(15) providing required notice of abandonment. Disposal of all materials shall be per all local and regulating agency requirements.
3. Septic tank abandonments and lateral connections (Item 7 in the EOPCC) assumed at each parcel within project limits for Areas 3 through 5. Area 5 quantity is assumed based on number of parcels and estimate of existing mobile homes / RV's from aerial imagery. Assumption is that each mobile home / RV, and pad is currently on a septic tank that shall be abandoned and converted to gravity collection system.
4. All roadway repair and construction shall be per FDOT standard requirements.
5. Drainage improvements not included in costs.
6. Cost per lb of total nitrogen removed is provided for two scenarios:
    a. Where overall project cost is considered.
    b. When septic tank abandonment (Item 7 in the EOPCC) is omitted from the cost, it is understood that FDEP and other funding agencies will provide a credit to the homeowners that offsets these incurred costs.

6. Summary and Conclusion

In review of the analysis, the most efficient area to implement a septic to sewer conversion appears to be project area 4 (Bay View Park Subdivision). However, project area 4 cannot be completed without the implementation of project area 2 (package plant conversion(s)). This effectively raises the cost per pound of nitrogen removed for project areas 2 and 4 to $8,080 per pound of nitrogen removed. Taking this into consideration, project areas 5 (Timber Shores, Cypress Knee Cove MHP, Burlington & Hartmans Subdivisions) and 3 (Crooked Lake Park Tracts 1 & 2, and South Lake Wales Yacht Club) become the most cost-effective projects as shown in **Table 4.1**. Project area 5 contains a mobile home park and will require gravity sewer in un-defined right-a-way. Without further investigation it is difficult to determine the extents of this cost and are not included in the analysis above. Therefore, it is recommended that project areas 5 and 3 move forward to the preliminary design phase of the program if funding is available for both locations. Additionally, both project areas could be candidates for advanced septic systems which should also be considered in the preliminary design phase.

Background

Degradation of water quality in Florida continues to be an issue throughout the state. Increasing loads of nutrients such as nitrogen (N) and phosphorus (P) from urban development and agriculture impact lakes and rivers. Recently, the Polk County Parks and Natural Systems Division (PCPNS) completed an update of the Florida Department of Environmental Protection (FDEP) Watershed Assessment Model (WAM) for the Upper Kissimmee River Watershed (UKRW) that lies within Polk County (**Figure 1**). This effort provided important information to Polk County on the lakes and other impaired water systems in the UKRW. As population increases in Polk County, land under agricultural use (e.g., citrus groves and pasturelands) as well as undeveloped areas has been or is planned to be converted to residential use.

Over the years many of these rural areas are outside of traditional utility service areas and have been served by septic tank systems. Upon review of the vast area of Polk County, there are several lakes or river systems that are considered to be impaired with respect to N and/or P concentrations. Septic systems are not the only source of these nutrients in these impaired water bodies, but based on proximity to surface waters, soil characteristics, age of systems and other factors they could be a major contributing source. For this project, Polk County Utilities (PCU) in collaboration with PCPNS, seeks to identify and evaluate opportunities in the Kissimmee River Basin to convert residential areas that are either currently served by septic tank systems or by smaller wastewater treatment facilities (WWTFs) (i.e., package plants) to centralized or advanced treatment systems to improve water quality. To do this, the tools developed in the FDEP WAM update (the existing conditions scenario), along with other sources of information, will be used to evaluate and prioritize areas for conversion with the goal to identify the infrastructure opportunities and environmental benefits to select a septic to sewer pilot project.

This technical note focuses on the use of WAM to evaluate a set of five projects within the UKRW (purple rectangles in **Figure 1**). These five projects entail residential communities served by either septic systems or package plants. The selection of the areas to investigate was done by Dewberry and the selected areas were provided to Soil and Water Engineering Technology, Inc. (SWET) to simulate using WAM. To evaluate these areas, the existing conditions scenario was altered by modifying either the land use (for communities utilizing septic systems) or by removing the inputs that simulate package plant discharge and redirecting it to larger centralized WWTFs that have the capability to provide advanced treatment.

The Upper Kissimmee WAM Setup

As mentioned above, the WAM setup for the UKRW is based on modifications of prior simulations developed for FDEP, the South Florida Water Management District (SFWMD), and the Florida Department of Agriculture and Consumer Services (FDACS). These simulations were conducted in 2017 and 2018 and included separate model simulations for each of the nine watersheds that comprise the entire Lake Okeechobee Watershed (LOW), one of which was the UKRW. This model setup was subsequently modified to simulate just the portion of the UKRW that lies within Polk County. That study began in 2021 and was completed in 2022 and was conducted in part to estimate nutrient loadings to several water bodies in the UKRW that are listed on the statewide comprehensive verified list of impaired water bodies. The period of record was from 1999 through 2020 and included an existing conditions scenario and five scenarios that estimated nutrient load reductions to the impaired water bodies through application of different Best Management Practices (BMPs).

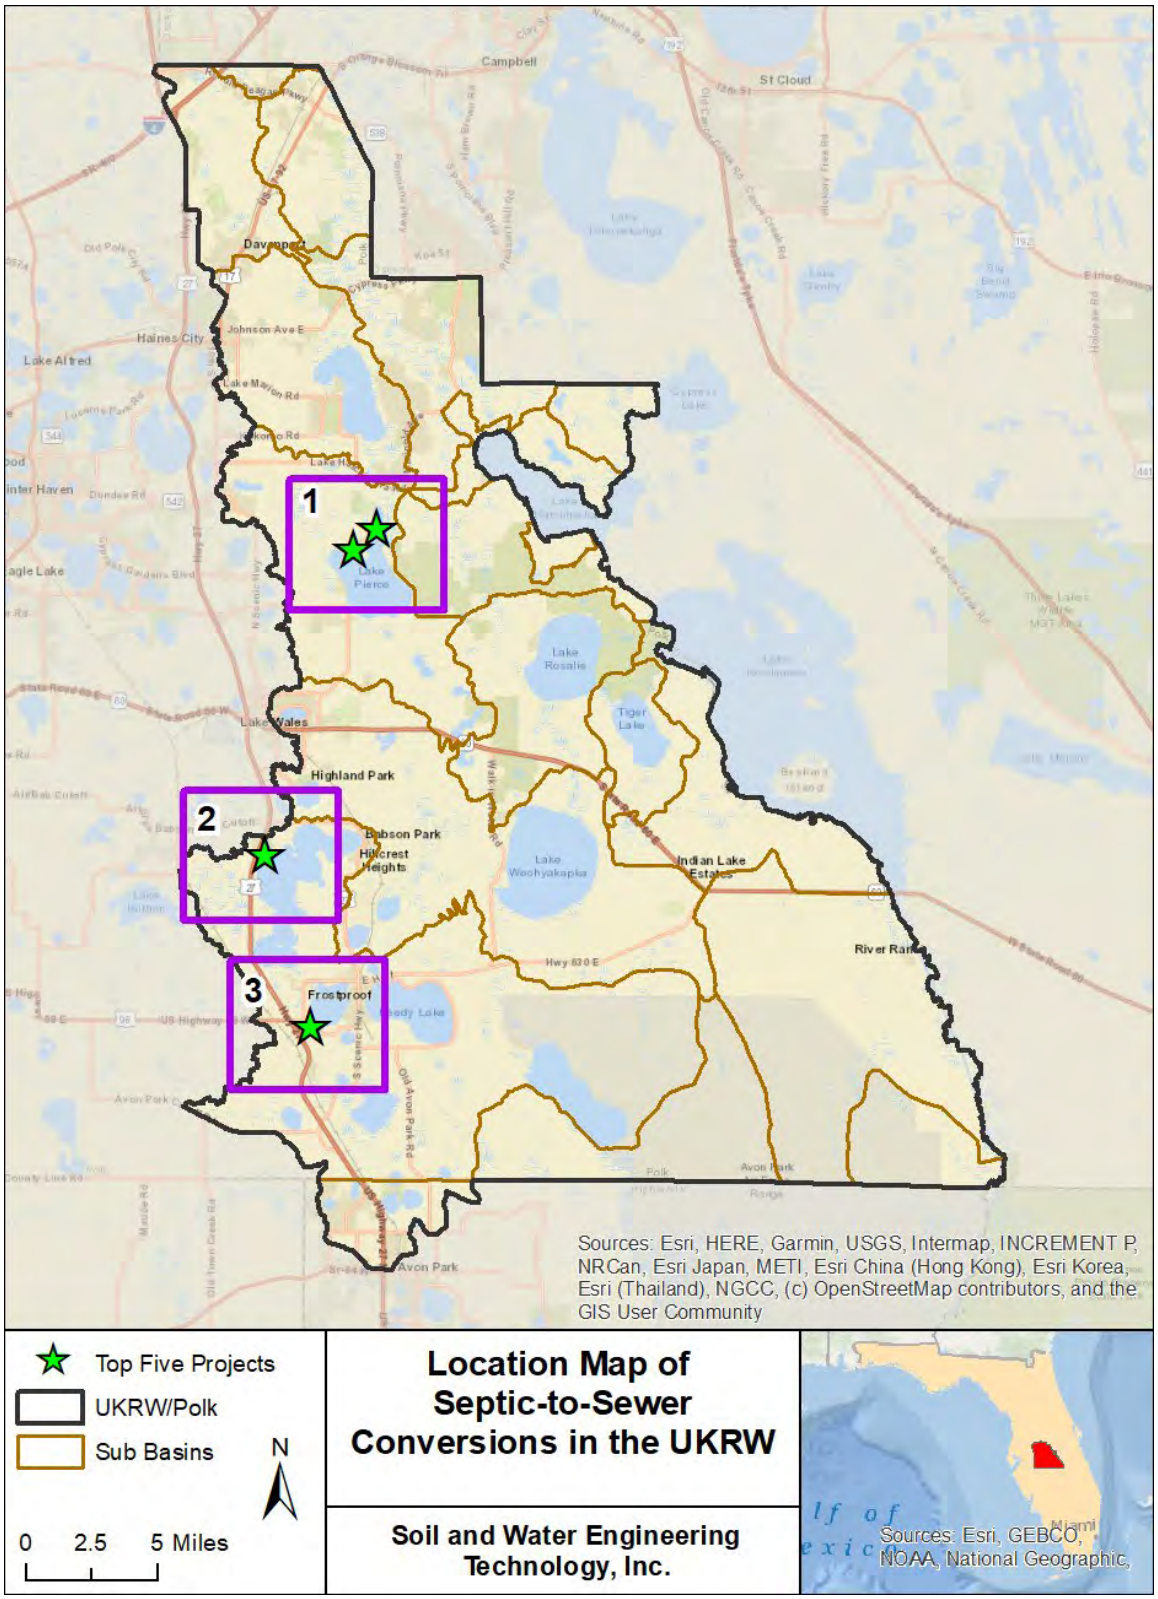

Figure 1. Location of the UKRW within Polk County. The three purple rectangles indicate the location of the five proposed projects. Rectangles 1 and 3 contain two proposed projects each. Note that area 3 has two immediately adjacent projects.

For the current study the prior existing conditions scenario from the 2022 was modified in the following ways:

1) The western boundary of the UKRW used in the original WAM setup was updated to match the boundary with the Peace River Watershed. The feature classes used in WAM were modified to match this boundary.
   The utility zones feature class used by WAM to delineate those urban areas that are served by WWTFs was extensively modified to incorporate sewer line location data provided by PCU to Dewberry. The utility zone feature class was also modified in areas outside PCU service areas using a feature class provided the Florida Department of Health (FDOH) that describes the wastewater treatment types (septic, sewer, etc.) for each parcel in the model domain.
2) The land use feature class was refined by updating areas that have undergone urban development after the original land use feature class was created. This modification was done using the PCU sewer utility line feature class discussed in the previous point.
3) Each WWTF in the model domain was added to the point source feature class and a polygon from the WAM utility zone feature class was associated with each WWTF. The point source feature class is used to add sources (or sinks) of water and nutrients to the model. The majority of the WWTFs added are smaller package plants serving mobile home parks or other small communities. Two of the larger Toho Water Authority WWTFs were added as well.

Proposed Projects

A shapefile of the five areas for the proposed projects was obtained from Dewberry. To simulate these with WAM a new scenario was created for each of the five projects by copying the existing conditions scenario and modifying the utility zone and/or point source feature class. For projects that involve diverting wastewater from small package plants the modifications are to remove the point sources representing the package plant and diverting the additional flow to the target WWTF. For projects that involve converting the septic systems to sewer, it requires adding an additional polygon to the utility zones feature class that matches the footprint of the project area. This modification causes WAM to divert wastewater produced by urban land uses within that polygon to be diverted to the target WWTF. In both cases, the additional wastewater flow and nutrient loads are added to the point source representing the target WWTF.

The five proposed projects are:

1. Jennings Resort MHP.
2. Fish Camp, Cypress Knee Cove MHP, Hartman subdivision and Burlington neighborhood (FCHB).
3. Crooked Lake Tract and Yacht Club.
4. Bay View Park subdivision.
5. Whispering Pines MHP, Lakemont Ridge Homes and RV Park, and Lakefront Trailer Park (WLL).

Note that projects 2 and 5 contain multiple neighborhoods and/or MHPs. The three areas shown in **Figure 1** are discussed below together with a brief discussion of the projects they contain to give some context for the location of each project.

Modeling Assumptions

A number of assumptions are made for various parameters in the simulation as well as general model setup. These are the assumptions that directly affect the calculation of nutrient reductions due to conversion of septic systems to utility sewer:

1. Population densities are:

    a. Low Density Residential: 1.7 people per acre
    b. Medium Density Residential: 5.8 people per acre
    c. High Density Residential: 19.8 people per acre.
2. Each household produces approximately 70 gallons of wastewater per person per day.
3. Nutrient concentrations (unattenuated) in wastewater leaving septic systems are:
    a. 52 mg/L soluble TN
    b. 30 mg/L soluble Organic N
    c. 12 mg/L soluble NH4
    d. 10 mg/L soluble NO3
    e. 1.3 mg/L soluble P (minimum) or 5.5 mg/L soluble P (maximum)
4. WAM assumes a 20% attenuation rate for all N constituents after entering groundwater (i.e., after leaving septic systems or RIBs) and a 90% attenuation of P.
5. There are no losses in the sewer systems.
6. Population is constant during the year.

Area 1

Area 1 is located in roughly the upper third of the UKRW and contains the Jennings Resort MHP project (project 1) and the FCHB project (project 2) (**Figure 2**). Both project areas are located on Lake Pierce (WAM reach number 152.) The Jennings Resort project is currently served by a package plant (Jennings Resort WWTF) and the residential areas in project 2 are on septic systems. These projects were simulated independently. The wastewater from both projects is assumed to be rerouted to the Toho Water Authority (TWA) Lake Marion facility, which is discharged into a set of Rapid Infiltration Basins (RIBs) after treatment. These RIBs straddle the sub-basin boundary between Lake Marion (WAM reach 132) and a wetland/slough (WAM reach 126) that discharges into Lake Hatchineha. For simulation purposes, the discharge from the TWA Lake Marion facility is split with half discharging into shallow groundwater into each sub-basin. Further details of each project are discussed below.

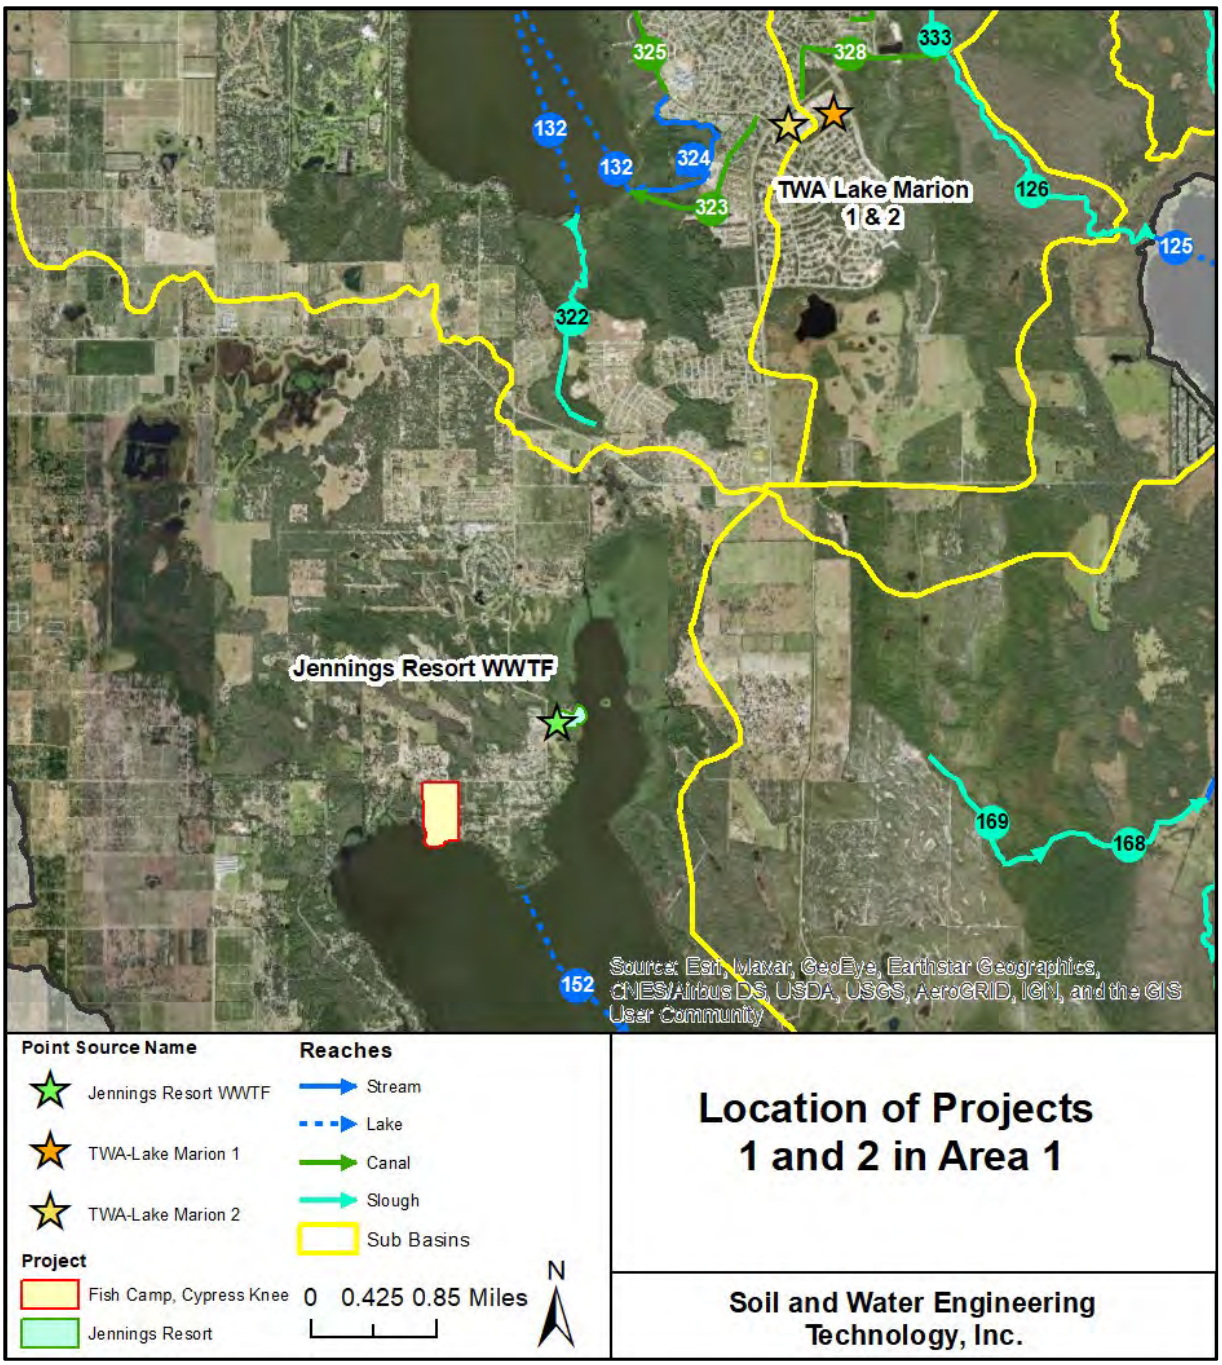

Figure 2. Projects 1 and 2 in Area 1 showing the project locations and the destination WWTFs (TWA Lake Marion facility.)

Jennings Resort MHP

Jennings Resort MHP (Area 1 in **Figure 1**, detail in **Figure 3**) is a 13.5-acre area located on the northern end of Lake Pierce that has lots for mobile homes and recreational vehicles. The Florida Land Use, Cover, and Forms Classification System (FLUCCS) code for this area is 1320 (Mobile Home Units) and corresponds to the WAM land use “High Density Residential”. It is currently served by a package plant (Jennings Resort WWTF, Facility ID FLA011052) with a design capacity of 0.012 MGD. The package plant discharges effluent to a RIB that is located about 200 feet from a short harbor connected to Lake

Pierce. In the existing conditions WAM setup this is simulated with the treated wastewater discharging from the RIB traveling via shallow subsurface flow into Lake Pierce. Lake Pierce is simulated by WAM Reach number 152. In the post-conditions scenario, all of the flow to the RIB is diverted to the TWA Lake Marion WWTF. Documents containing wastewater flow and nitrate concentrations are available from https://prodenv.dep.state.fl.us/DepNexus/public/electronic-documents/FLA011052/gis-facility!search

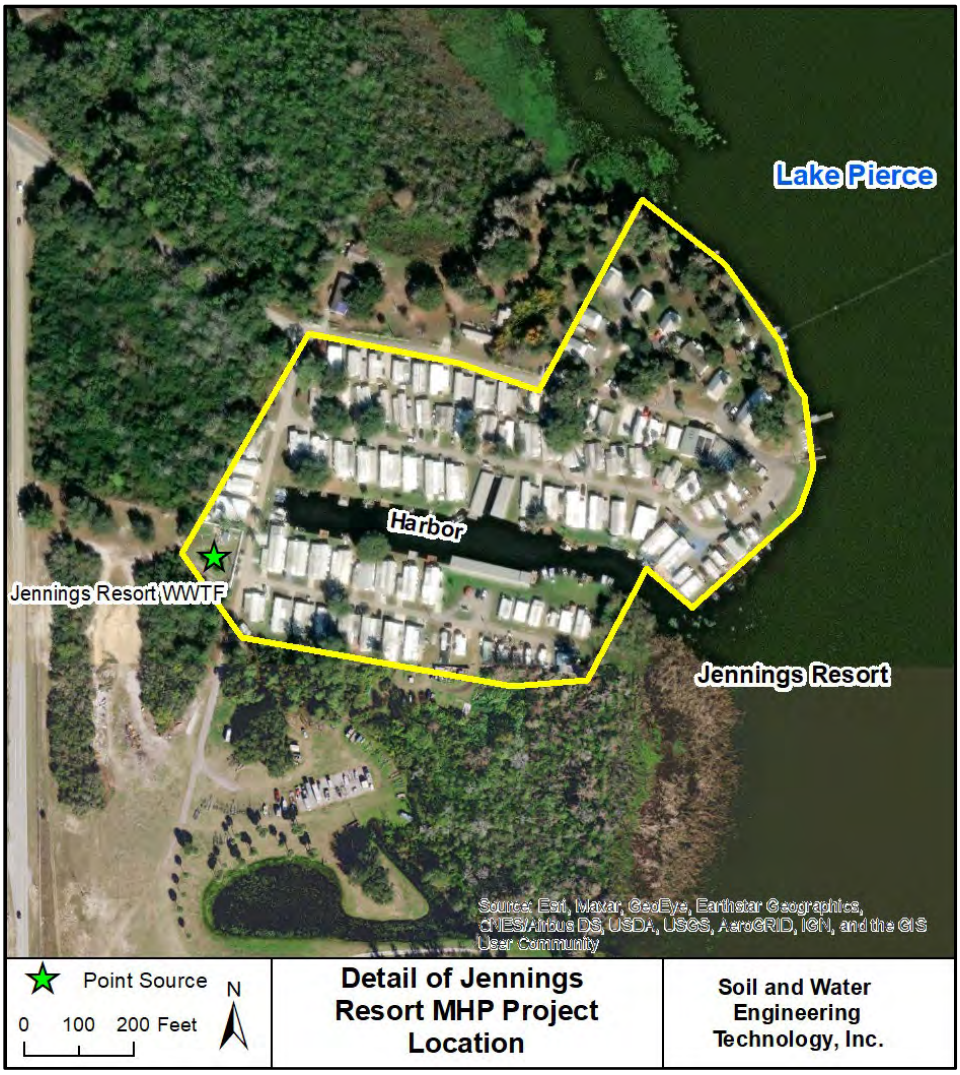

Figure 3. Detail of Area 1: location of Jennings Resort MHP.

Fish Camp, Cypress Knee Cove MHP, Hartman subdivision and Burlington neighborhood

This project contains several different subdivisions and a mobile home park (Area 1 in **Figure 1**, detail in **Figure 4**). This is a 63-acre area also located on the northern end of Lake Pierce about a mile south-west of the Jennings Resort MHP. This area contains several subdivisions with single family residences and a mobile home park. The FLUCCS codes for the residential areas include about 43 acres coded 1110 (Fixed Single Family Units/Residential Low Density) which corresponds to the WAM land use “Low Density Residential”, about 3.5 acres coded 1230 (Mixed Units, Fixed and Mobile Home Units) which corresponds to WAM land use “Medium Density Residential”, and about 3.75 acres coded 1320 (Mobile Home Units) which corresponds to “High Density Residential”. All of the residential areas appear to be

served by septic systems. Note that the project area includes about 7.5 acres coded 4200 (Upland Hardwood Forests), a native land use that is assumed to be unpopulated. It is assumed that wastewater generated from these urban land uses will be routed to the TWA Lake Marion WWTF.

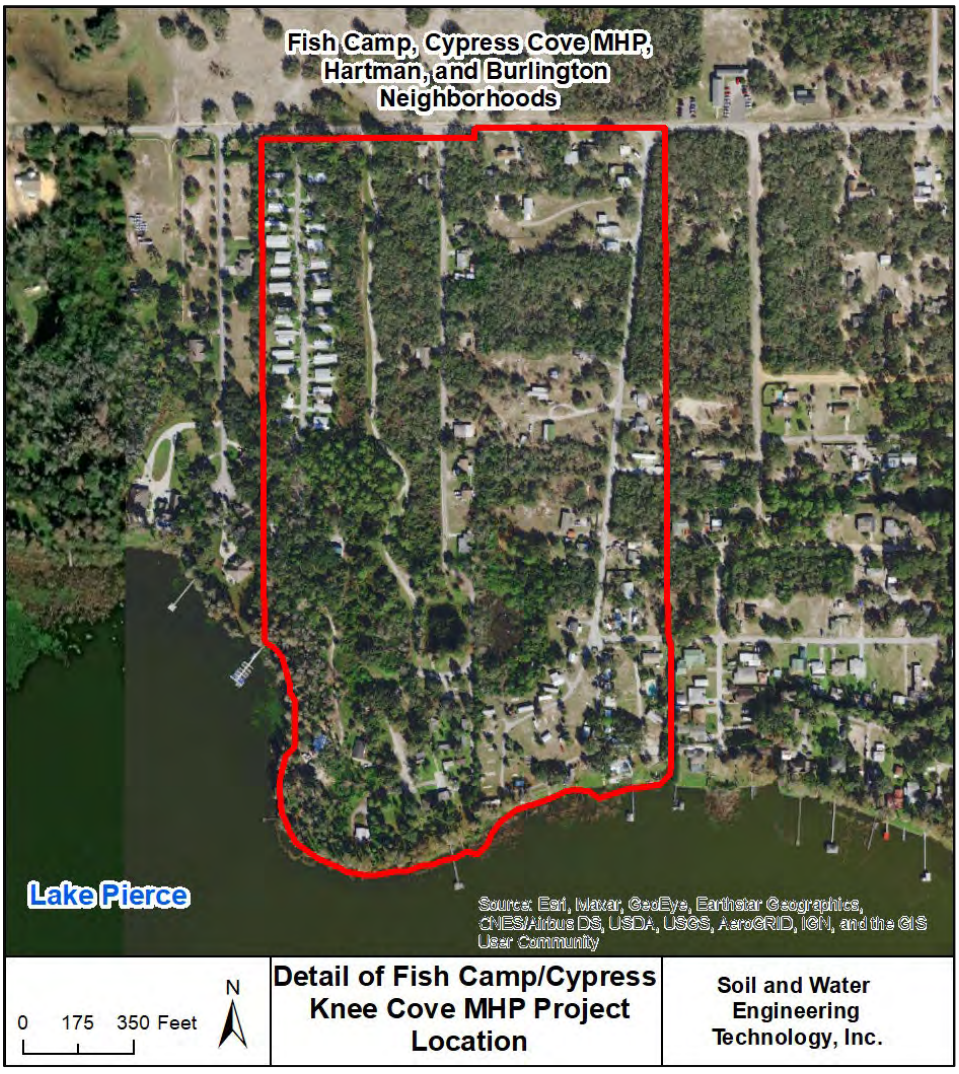

Figure 4. Detail of Area 1: location of the Jennings Resort and FCHB project areas.

Area 2

Area 2 contains a single project, the Crooked Lake Park tract and Yacht Club. This project is located immediately adjacent to Crooked Lake, which is represented in the simulation by WAM reach 67. It is assumed that the wastewater generated by the urban areas with the project footprint that are currently on septic systems will be routed to the Crooked Lake Park Sewerage WWTF. A second alternative project is to reroute both the wastewater from the septic systems and the wastewater currently serviced by the Crooked Lake Park Sewerage Company WWTF to another, as yet undetermined, WWTF.

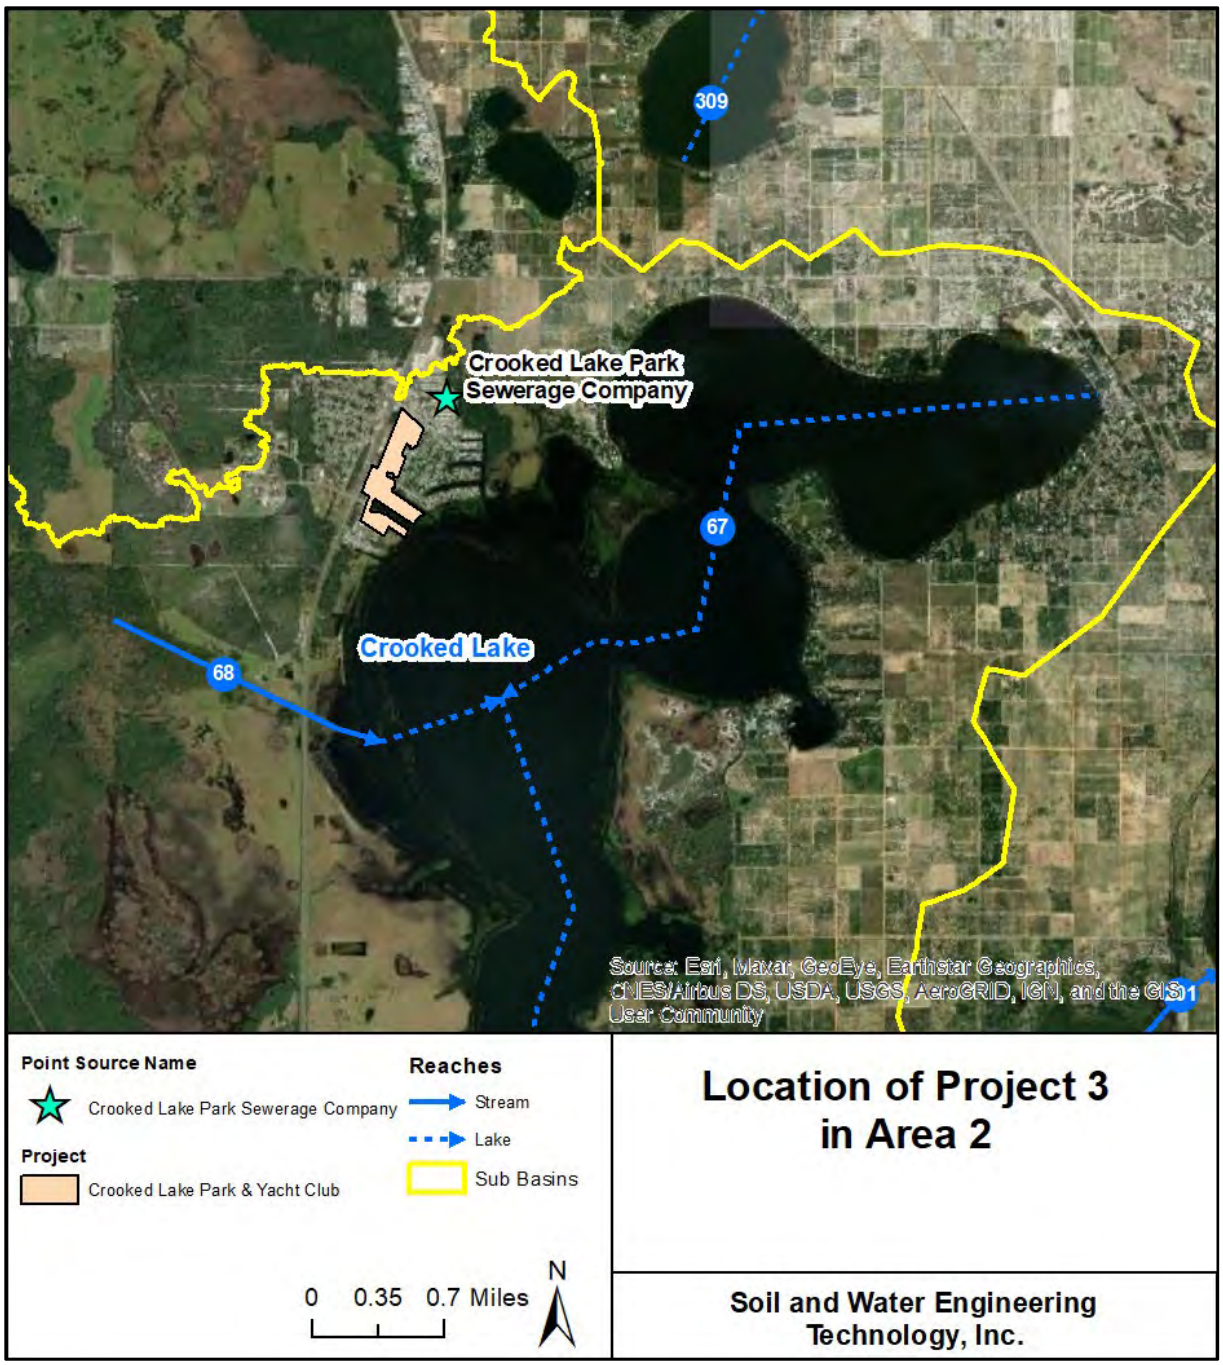

Figure 5. Project 3 in Area 2 showing the project locations and the destination WWTF (Crooked Lake Park Sewerage Company.)

Crooked Lake Park tract and Yacht Club

This is a 68-acre area located on the north-west edge of Crooked Lake (Area 2 in **Figure 1**, detail in **Figure 6**). This area contains mostly single-family residences with a few multi-family units and some commercial areas. The FLUCCS codes include about 35.75 acres coded 1200 (Residential Medium Density, 2 To 5 dwelling units/acre) that correspond to the WAM land use “Medium Density Residential”, about 5.33 acres coded 1400 (Commercial and Services) which corresponds to WAM land use “Commercial and Services”, and about 4 acres coded 1700 (Institutional) that also are assigned a WAM

land use of “Commercial and Services”. These are currently assumed to be using septic systems. It is adjacent to other homes in the Crooked Lake Park subdivision that is currently served by the nearby Crooked Lake Park Sewerage Company WWTF (Facility ID FLA013038) with a design capacity of 0.06 MGD.

Figure 6. Detail of Area 2: location of the Crooked Lake Park project area.

Area 3

Area 3 is located in the south-west portion of the UKRW and contains the Bay View Park neighborhood project (project 4) and the combined WLL neighborhoods into a single project (project 5) (**Figure 7**). Both project areas are located on Lake Clinch (WAM reach number 63). The Bay View Park neighborhood is currently served by septic systems, while each of the WLL neighborhoods are individually served by package plants. Projects 4 and 5 were simulated independently. The wastewater from both projects is assumed to be rerouted to the Polk County Utilities Sun Ray facility, which discharges the treated wastewater into a set of Rapid Infiltration Basins. The treated wastewater leaving the RIBs is assumed to travel via shallow groundwater to WAM reach 73, which eventually discharges into Lake Livingston.

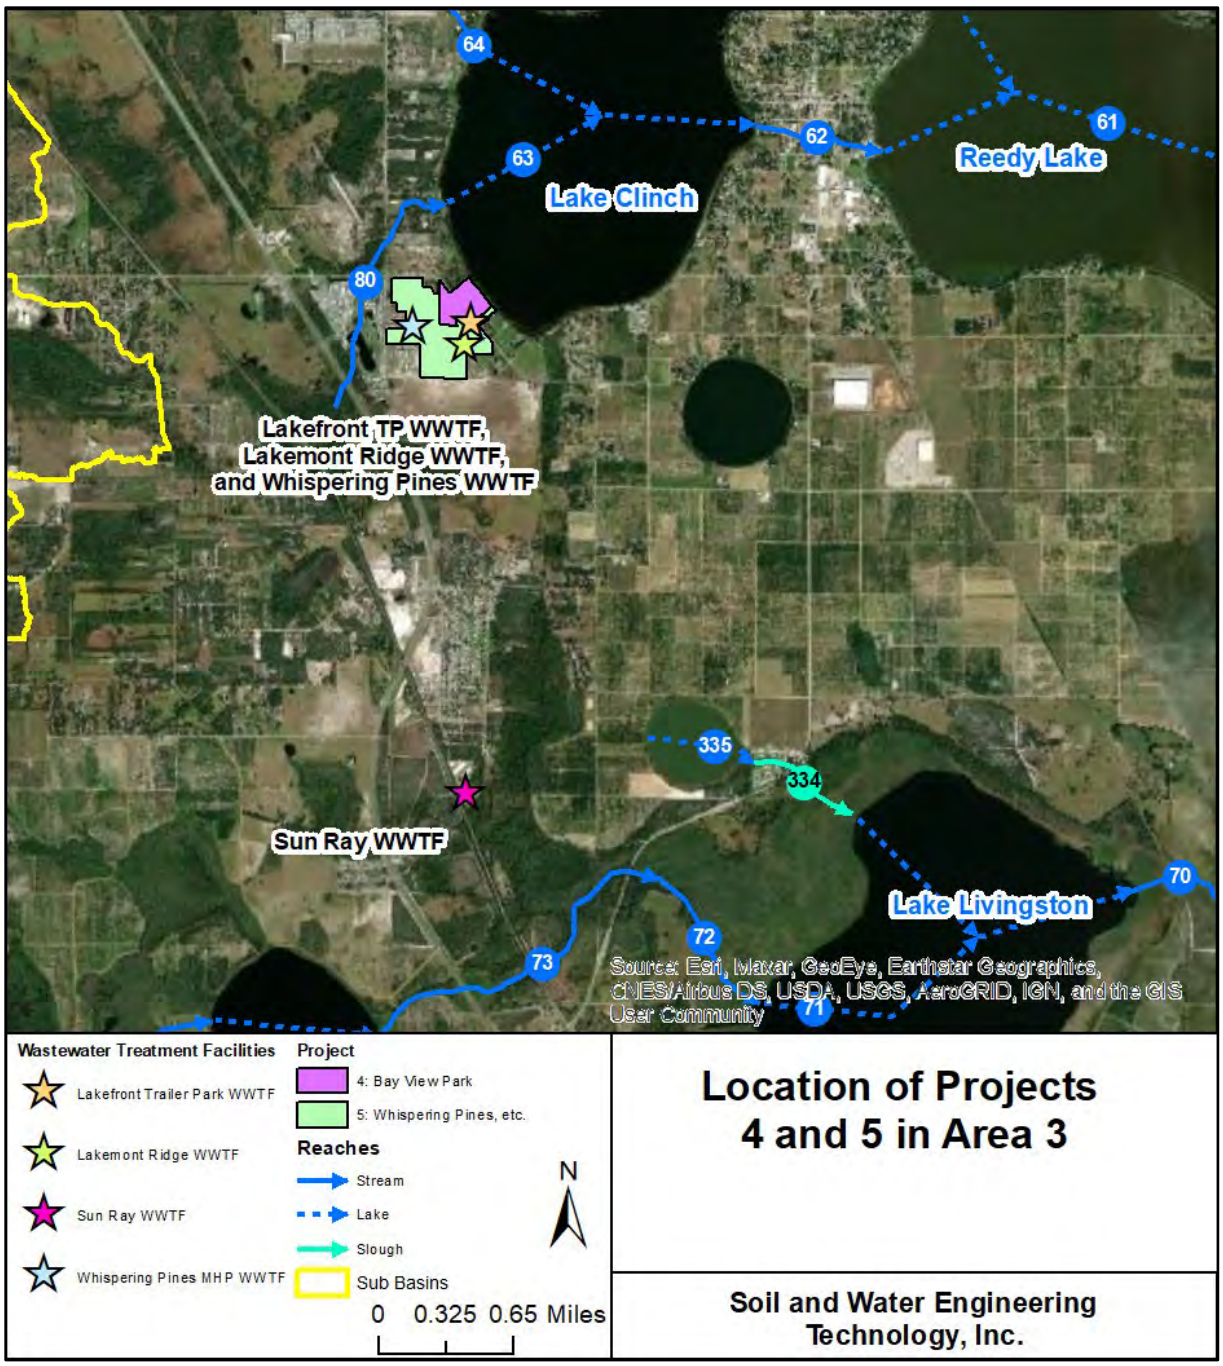

Figure 7. Overview of Area 3 showing projects 4 and 5 and the destination WWTF (Sun Ray WWTF.)

Bay View Park Subdivision

This is a 24-acre area located on the south-west end of Lake Clinch with mobile homes and single-family residences that appear to be served by septic systems (Area 3 in **Figure 1**, detail in **Figure 8**). The FLUCCS codes for this project area include about 13 acres coded 1200 (Residential Medium Density, 2 To 5 dwelling units/acre) corresponding to WAM land use “Medium Density Residential” and 11.3 acres coded 1300 (Residential High Density) corresponding to WAM land use “High Density Residential”. The area coded as medium density residential is immediately adjacent to Lake Clinch. It is assumed that wastewater generated by this project area will be routed to the PCU Sun Ray WWTF.

Figure 8. Detail of Area 3: location of the Bay View Park project areas.

Whispering Pines MHP, Lakemont Ridge Homes and RV Park, and Lakefront Trailer Park

(Area 3 in **Figure 1**, detail in **Figure 9**. This is an 86-acre area, also located on the south-west end of Lake Clinch and immediately adjacent to the Bay View Park area. This is a grouping of three high-density mobile home/recreational vehicle parks, each currently served by their own package plants. All land uses within the project are coded 1300 (Residential High Density), corresponding to WAM land use "High Density Residential". Whispering Pines MHP is served by a WWTF with a design capacity of 0.011 MGD (Facility ID FLA013005) with documents available at https://prodenv.dep.state.fl.us/DepNexus/public/electronic-documents/FLA013005/gis-facility!search. Lakemont Ridge Home and RV Park is served by a WWTF with a design capacity of 0.03 MGD (Facility ID FLA012998) with documents available at https://prodenv.dep.state.fl.us/DepNexus/public/electronic-documents/FLA012998/gis-facility!search. Lastly, Lakefront Trailer Park is served by a WWTF with a design capacity of 0.0057 MGD (Facility ID FLA012995) with documents available at https://prodenv.dep.state.fl.us/DepNexus/public/electronic-documents/FLA012995/gis-facility!search

It is assumed that all the wastewater serviced by the three package plants will be rerouted to the PCU Sun Ray WWTF.

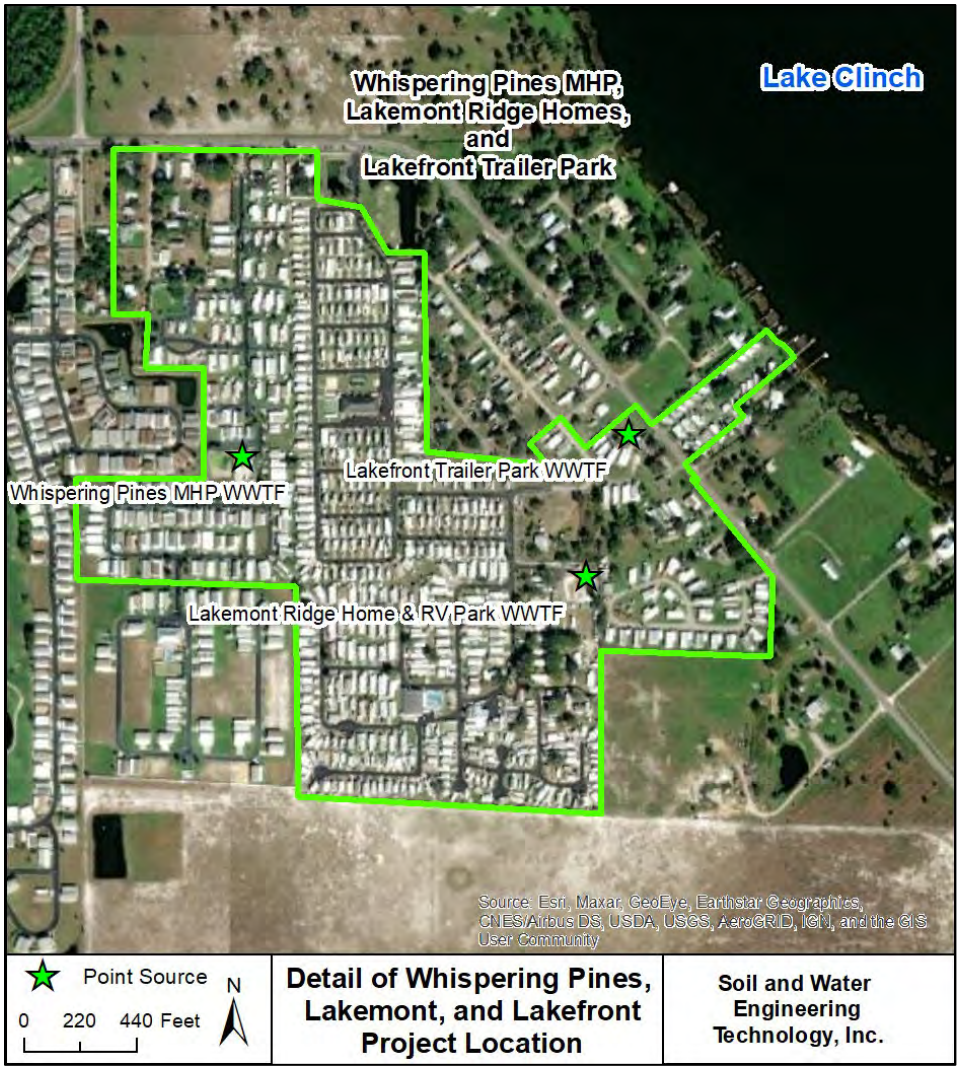

Figure 9. Detail of Area 3: location of the Whispering Pines, Lakemont Ridge, and Lakefront Trailer Park project areas.

Recent Package Plant Flow and Nutrient Concentrations

To determine the current volume of wastewater being serviced by the package plants in Jennings MHP and the WLL area, data over a five-year period was collected from the FDEP Nexus database using the links give above (**Table 1**). Annual average flows are available for each of the package plants, although Lakemont Ridge stopped providing annual average values in 2020. Daily flows are recorded for each plant, and the annual averages are calculated using those data. Unfortunately, nitrate concentrations are only measured once a month by a grab sample, and annual averages must be calculated by obtaining the concentration data from each monthly report and averaging. This assumes that the once-monthly grab sample is sufficiently representative to calculate an annual average. Furthermore, nitrate is the only nutrient concentration provided for these package plants; no other forms of N and no data on P concentrations are given. The PCU and TWA WWTFs provide much of this data, but those provide more advanced treatment and are not strictly comparable to the package plants which typically provide secondary treatment levels. Measured nutrient concentrations from the PCU and TWA WWTFs typically average 3 – 3.5 mg/L NO3, less than 0.5 mg/L NH4 (where measured), 3.5 – 4 mg/L TN, and 2.5 to 3.5 mg/L TP. Exceptions to this are the PCU Waverly facility, which has low effluent NO3 concentrations

around 0.3 mg/L, NH4 concentrations over 4 mg/L and TN concentrations around 5.5 mg/L. Higher NH4/NO3 ratios indicate lower degrees of nitrification of NH4 in effluent.

Table 1. Annual average flow for package plants to be rerouted.

	Jennings MHP	Whispering Pines MHP	Lakemont Ridge	Lakefront Trailer Park
Year	Flow MGD	Flow MGD	Flow MGD	Flow MGD
2018	0.006	0.009	0.011	0.0033
2019	0.005	0.008	0.01	0.0031
2020	0.006	0.013	0.01†	0.0026
2021	0.003	0.01	0.01 †	0.0029
2022	0.004	0.011	0.01 †	0.0024
†: annual averages not provided for these years.				

For these simulations an estimate of concentrations of the various forms of N entering the groundwater beneath the Rapid Infiltration Basins (RIBs) is required. The assumed treatment system is:

Raw sewage → Secondary treatment → effluent → RIB → vadose zone → groundwater.

Concentrations of the soluble fraction of TN in effluent from secondary treatment systems are typically in the 10 – 15 mg/L range, with roughly 80% NH4, 15% soluble organic N, and about 5% NO3 with the exact percentages depending on how much nitrification occurs during treatment. A study of NO3 concentrations leaving percolation ponds indicated measurements in the range of 3 to 14 mg/L (as N). It is assumed here that additional nitrification occurs in the RIB and subsequent transport through the vadose zone, with some volatilization of ammonia during this time resulting in a reduction in TN concentrations. With this assumption, the estimated concentrations of the various components of N entering groundwater beneath a RIB (unattenuated concentrations) are 8 mg/L NO3, 3 mg/L dissolved organic N, and 1 mg/L NH4. Attenuated N concentrations (assuming 20% removal for N) are 6.4, 2.4, and 0.8 mg/L, respectively. Estimated unattenuated soluble TP concentrations leaving a RIB are estimated to be 2.0 mg/L, or 0.2 mg/L P attenuated. These are the values used to estimate point source concentrations for the two project scenarios where wastewater is treated locally at a small package plant, i.e., the Jennings Resort MHP project and the WLL project. As mentioned above, limited NO3 data are available for these package plants, but no TN, NH4, or TP data are available. The average measured effluent NO3 values for these plants range from 0.5 mg/L (Whispering Pines) to around 4 to 4.5 mg/L (Lakemont Ridge and Lakefront Trailer Park). The concentrations used here assume that relatively large concentrations of NH4 (4 to 8 mg/L) are undergoing nitrification before entering groundwater.

When simulating these two projects, the point source flow and nutrient concentrations are set to zero for the specific project being simulated since the wastewater is being diverted to the new destination WWTF. For example, when simulating the Jennings Resort MHP project, the flow and concentration data for that package plant are set to zero but other package plants are left as is. The water flow from Jennings Resort MHP was added to the Toho Water Authority WWTF, but the concentrations used are those given by data provided by the Nexus site for the Toho WWTF since it is assumed that all wastewater will be treated to the same level.

Simulation Results

Each project scenario was created by copying the existing conditions scenario and changing the utility zones feature class to designate an area to be served by a sewer system and/or altering the point source data by removing the flows and nutrient concentrations if the wastewater discharging to the package plant is to be rerouted to another WWTF. If the package plant is removed, an equivalent volume of wastewater is added to the destination WWTF if it is within the model domain. If a polygon is added to the utility zone feature class, a volume of wastewater is added to the destination WWTF based on the population density and area of the project in the WAM scenario.

Reductions to Receiving Water Bodies

The estimated water and nutrient loading from the contributing area of the receiving water bodies in the project area in the existing conditions (pre) and after project implementation (post), as well as the reduction and percentage reduction are shown in **Table 2**. Estimated volume is given in average annual acre-feet (ac-ft/y) and nutrient reductions are shown in average annual pounds per year (lbs/y).

All projects show net reductions in all forms of N, particularly with respect to ammonia and organic N. Five of the six scenarios show reductions in P as well with the scenario for Crooked Lake tract the septic systems routed to Crooked Lake Sewerage showing a slight increase in P. This results from the lower efficiency of the WWTF in removing P. The Bay View Park project shows the largest reduction in TN both in absolute and percentage terms. This is most likely due to the presence of the high-density residential area served by septic systems immediately adjacent to Lake Clinch. The Crooked Lake, FCHB, and WLL projects show roughly the same percentage TN reduction at between 1.3 and 1.8%. In absolute terms, the Crooked Lake (with all wastewater rerouted to an external WWTF) and the FCHP projects show the most TN reduction following the Bay View Park project. Note that while the Jennings MHP project show relatively small TN reductions, the project area is less than half the next smallest project area, the Bay View Park project.

Note that the wastewater from these project areas will need to be rerouted to another WWTF that, with the exception of the Crooked Lake project, is in a different sub-basin than the source project area. Most likely, the Jennings and FCHB projects would be rerouted to the TWA Lake Marion WWFT and the Bay View Park and WLL projects would be rerouted to the PCU Sun Ray WWTF. This would result in an increase in nutrients discharged from those WWTFs. However, since these are larger facilities that use more advanced treatment systems, it would be expected that concentrations of the various N constituents would be significantly reduced, while P concentrations may be reduced depending on the efficiency of the WWTF.

Table 2. Estimated nutrient reductions from the five project areas.

Summary and Conclusions

An existing conditions model setup was developed using WAM and applied to the UKRW. Five separate scenarios were developed to simulate changes in water and nutrient loading due to updating of updated wastewater treatment systems. Three of the scenarios examined conversion of septic systems to sewer systems conveying wastewater to centralized WWTFs, while the remaining two examined deactivation of small, localized package plants serving mobile home and recreational vehicle communities and rerouting of the wastewater to centralized WWTFs.

Each of the scenarios demonstrated reduction in the various N constituents such as NO3 and NH4 and TN, while four of the five projects show reductions in P. The estimated reductions are dependent on knowing how effective the septic systems and package plants are at nutrient removal, which may vary from neighborhood to neighborhood depending on the age of the systems and the underlying soil type. Even with those caveats, such estimates can be useful in determining the cost effectiveness of implementing these treatment systems.

NOTES:

1. Preliminary costs do not include land acquisitions or easement costs.
2. Decommissioning of Package WWTF to be per FAC 62-620.610(15) providing required notice of abandonment. Disposal of all materials shall be per all local and regulating agency requirements.
3. Septic tank abandonments and lateral connections (Section 7.0) assumed at each parcel within project limits for Areas 3 through 5. Area 5 quantity is assumed based on number of parcels and estimate of existing mobile homes / RV's from aerial imagery. Assumption is that each mobile home / RV, and pad is currently on a septic tank that shall be abandoned and converted to gravity collection system.
4. All roadway repair and construction shall be per FDOT standard requirements.
5. Drainage improvements not included in costs.
6. Improvements to Area 4 (Bay View) do not include the costs of conversion of the Area 2 WWTF located at Katie Lane to a PCU standard Lift Station, those costs and improvements would need to be complete prior to the septic to sewer conversion project Area 4 can be placed online.
7. Cost per lb of total nitrogen removed is provided for two scenarios: 1. Where overall project cost is considered; 2.When septic tank abandonments (items 7) is omitted from the costs. It is understood that FDEP and other funding agencies provide a credit to the homeowners that offsets these incurred costs.
