

To: Polk County Board of County Commissioners

CC: Ivan Nance, Polk County Planner

Date: December 29, 2025

Re: LDCU-2025-29

Enclosed are original signatures per item of Polk County residents expressing their deep concern in regards to the appeal hearing for LDCU-2025-29.

Your continued sincere consideration and full review of all documentation on the incompatibility of this proposal is requested and valued.

Thank you for your time and commitment to the residents of Polk County.

Respectfully,

Sand Mine Communication Team

LDCU-2025-29

Concerns Regarding Health Impacts of Silica Dust and Increased Traffic

December 29, 2025

Saddlebag Lake Resort, Lake Wales Florida

To the Honorable County Commissioners and Planning Department,

I am writing as a concerned resident regarding the proposed development of a Sand Mine pit that is expected to result in the daily addition of more than 500 trucks travelling along our already busy highway, State Road 60. I respectfully urge you to consider the significant health and safety impacts this proposal may have on our community, our lives matter.

Health Impacts of Silica Dust

One of the most pressing concerns is the increased exposure to respirable crystalline silica dust. Silica dust, generated from activities such as construction, mining, and heavy truck traffic, is a known health hazard. Prolonged or repeated exposure can lead to serious respiratory illnesses, including silicosis, chronic obstructive pulmonary disease (COPD), and even lung cancer. Vulnerable populations such as children, seniors, and those with pre-existing respiratory conditions are particularly at risk.

The fine particles of silica dust can travel significant distances from their source, especially when stirred up by large volumes of truck traffic. Even with dust suppression measures, the sheer increase in heavy vehicle movements heightens the risk of airborne particulate matter in residential and school zones near the highway. This situation could lead to increased rates of asthma, bronchitis, and other respiratory ailments in our community.

Traffic and Road Safety Concerns

The addition of over 500 trucks per day on our highway will not only exacerbate air quality issues but also raise serious traffic safety concerns. State Road Highway 60 is already heavily used, and this increase will contribute to congestion, longer commute times, and a higher likelihood of traffic accidents. Large trucks require more stopping distance and have larger blind spots, which can increase the risk of collisions, especially in areas where there are driveways, crosswalks, or school bus stops.

The increased traffic will also accelerate wear and tear on our roads, leading to more frequent maintenance needs and potential hazards such as potholes and deteriorating pavement. This can pose further risks to motorists, cyclists, and pedestrians alike. Roughly half of these trucks will pass west through Lake Wales congested commercial district as well as local schools.

Our community's health and safety must remain a top priority. I urge you to fully evaluate the risks and deny this appeal proposal.

Thank you for your attention to these critical issues.

Sincerely,

Silica dust, generated from activities such as construction, mining, and heavy truck traffic, is a known health hazard. Prolonged or repeated exposure can lead to serious respiratory illnesses, including silicosis, chronic obstructive pulmonary disease (COPD), and even lung cancer. Vulnerable populations such as children, seniors, and those with pre-existing respiratory conditions are particularly at risk.

The fine particles of silica dust can travel significant distances from their source, especially when stirred up by large volumes of truck traffic. Even with dust suppression measures, the sheer increase in heavy vehicle movements heightens the risk of airborne particulate matter in residential and school zones near the highway. This situation could lead to increased rates of asthma, bronchitis, and other respiratory ailments in our community.

Traffic and Road Safety Concerns

The addition of over 500 trucks per day on our highway will not only exacerbate air quality issues but also raise serious traffic safety concerns. State Road Highway 60 is already heavily used, and this increase will contribute to congestion, longer commute times, and a higher likelihood of traffic accidents. Large trucks require more stopping distance and have larger blind spots, which can increase the risk of collisions, especially in areas where there are driveways, crosswalks, or school bus stops.

The increased traffic will also accelerate wear and tear on our roads, leading to more frequent maintenance needs and potential hazards such as potholes and deteriorating pavement. This can pose further risks to motorists, cyclists, and pedestrians alike. Roughly half of these trucks will pass west through Lake Wales congested commercial district as well as local schools.

Our community's health and safety must remain a top priority. I urge you to fully evaluate the risks and deny this appeal proposal.

Thank you for your attention to these critical issues.

Sincerely,

Concerns Regarding Health Impacts of Silica Dust and Increased Traffic

December 29, 2025

Saddlebag Lake Resort, Lake Wales Florida

To the Honorable County Commissioners and Planning Department,

I am writing as a concerned resident regarding the proposed development of a Sand Mine pit that is expected to result in the daily addition of more than 500 trucks travelling along our already busy highway, State Road 60. I respectfully urge you to consider the significant health and safety impacts this proposal may have on our community, our lives matter.

Health Impacts of Silica Dust

One of the most pressing concerns is the increased exposure to respirable crystalline silica dust. Silica dust, generated from activities such as construction, mining, and heavy truck traffic, is a known health hazard. Prolonged or repeated exposure can lead to serious respiratory illnesses, including silicosis, chronic obstructive pulmonary disease (COPD), and even lung cancer. Vulnerable populations such as children, seniors, and those with pre-existing respiratory conditions are particularly at risk.

The fine particles of silica dust can travel significant distances from their source, especially when stirred up by large volumes of truck traffic. Even with dust suppression measures, the sheer increase in heavy vehicle movements heightens the risk of airborne particulate matter in residential and school zones near the highway. This situation could lead to increased rates of asthma, bronchitis, and other respiratory ailments in our community.

Traffic and Road Safety Concerns

The addition of over 500 trucks per day on our highway will not only exacerbate air quality issues but also raise serious traffic safety concerns. State Road Highway 60 is already heavily used, and this increase will contribute to congestion, longer commute times, and a higher likelihood of traffic accidents. The increased traffic will also accelerate wear and tear on our roads, leading to more frequent maintenance needs and potential hazards such as potholes and deteriorating pavement. This can pose further risks to motorists, cyclists, and pedestrians alike. Roughly half of these trucks will pass west through Lake Wales congested commercial district as well as local schools.

Our community's health and safety must remain a top priority. I urge you to fully evaluate the risks and deny this appeal proposal.

Thank you for your attention to these critical issues.

Sincerely,

Concerns Regarding Health Impacts of Silica Dust and Increased Traffic

December 29, 2025

Saddlebag Lake Resort, Lake Wales Florida

To the Honorable County Commissioners and Planning Department,

I am writing as a concerned resident regarding the proposed development of a Sand Mine pit that is expected to result in the daily addition of more than 500 trucks travelling along our already busy highway, State Road 60. I respectfully urge you to consider the significant health and safety impacts this proposal may have on our community, our lives matter.

Health Impacts of Silica Dust

One of the most pressing concerns is the increased exposure to respirable crystalline silica dust. Silica dust, generated from activities such as construction, mining, and heavy truck traffic, is a known health hazard. Prolonged or repeated exposure can lead to serious respiratory illnesses, including silicosis, chronic obstructive pulmonary disease (COPD), and even lung cancer. Vulnerable populations such as children, seniors, and those with pre-existing respiratory conditions are particularly at risk.

The fine particles of silica dust can travel significant distances from their source, especially when stirred up by large volumes of truck traffic. Even with dust suppression measures, the sheer increase in heavy vehicle movements heightens the risk of airborne particulate matter in residential and school zones near the highway. This situation could lead to increased rates of asthma, bronchitis, and other respiratory ailments in our community.

Traffic and Road Safety Concerns

The addition of over 500 trucks per day on our highway will not only exacerbate air quality issues but also raise serious traffic safety concerns. State Road Highway 60 is already heavily used, and this increase will contribute to congestion, longer commute times, and a higher likelihood of traffic accidents. Large trucks require more stopping distance and have larger blind spots, which can increase the risk of collisions, especially in areas where there are driveways, crosswalks, or school bus stops.

The increased traffic will also accelerate wear and tear on our roads, leading to more frequent maintenance needs and potential hazards such as potholes and deteriorating pavement. This can pose further risks to motorists, cyclists, and pedestrians alike. Roughly half of these trucks will pass west through Lake Wales congested commercial district as well as local schools.

Our community's health and safety must remain a top priority. I urge you to fully evaluate the risks and deny this appeal proposal.

Thank you for your attention to these critical issues.

Sincerely,

Prolonged or repeated exposure can lead to serious respiratory illnesses, including silicosis, chronic obstructive pulmonary disease (COPD), and even lung cancer. Vulnerable populations such as children, seniors, and those with pre-existing respiratory conditions are particularly at risk.

The fine particles of silica dust can travel significant distances from their source, especially when stirred up by large volumes of truck traffic. Even with dust suppression measures, the sheer increase in heavy vehicle movements heightens the risk of airborne particulate matter in residential and school zones near the highway. This situation could lead to increased rates of asthma, bronchitis, and other respiratory ailments in our community.

Traffic and Road Safety Concerns

The addition of over 500 trucks per day on our highway will not only exacerbate air quality issues but also raise serious traffic safety concerns. State Road Highway 60 is already heavily used, and this increase will contribute to congestion, longer commute times, and a higher likelihood of traffic accidents. Large trucks require more stopping distance and have larger blind spots, which can increase the risk of collisions, especially in areas where there are driveways, crosswalks, or school bus stops.

The increased traffic will also accelerate wear and tear on our roads, leading to more frequent maintenance needs and potential hazards such as potholes and deteriorating pavement. This can pose further risks to motorists, cyclists, and pedestrians alike. Roughly half of these trucks will pass west through Lake Wales congested commercial district as well as local schools.

Our community's health and safety must remain a top priority. I urge you to fully evaluate the risks and deny this appeal proposal.

Thank you for your attention to these critical issues.

Sincerely,

Concerns Regarding Health Impacts of Silica Dust and Increased Traffic

December 29, 2025

Saddlebag Lake Resort, Lake Wales Florida

To the Honorable County Commissioners and Planning Department,

I am writing as a concerned resident regarding the proposed development of a Sand Mine pit that is expected to result in the daily addition of more than 500 trucks travelling along our already busy highway, State Road 60. I respectfully urge you to consider the significant health and safety impacts this proposal may have on our community, our lives matter.

Health Impacts of Silica Dust

One of the most pressing concerns is the increased exposure to respirable crystalline silica dust. Silica dust, generated from activities such as construction, mining, and heavy truck traffic, is a known health hazard. Prolonged or repeated exposure can lead to serious respiratory illnesses, including silicosis, chronic obstructive pulmonary disease (COPD), and even lung cancer. Vulnerable populations such as children, seniors, and those with pre-existing respiratory conditions are particularly at risk.

The fine particles of silica dust can travel significant distances from their source, especially when stirred up by large volumes of truck traffic. Concerns Regarding Health Impacts of Silica Dust and Increased Traffic

December 29, 2025

Saddlebag Lake Resort, Lake Wales Florida

To the Honorable County Commissioners and Planning Department,

I am writing as a concerned resident regarding the proposed development of a Sand Mine pit that is expected to result in the daily addition of more than 500 trucks travelling along our already busy highway, State Road 60. I respectfully urge you to consider the significant health and safety impacts this proposal may have on our community, our lives matter.

Health Impacts of Silica Dust

One of the most pressing concerns is the increased exposure to respirable crystalline silica dust. Silica dust, generated from activities such as construction, mining, and heavy truck traffic, is a known health hazard. Prolonged or repeated exposure can lead to serious respiratory illnesses, including silicosis, chronic obstructive pulmonary disease (COPD), and even lung cancer. Vulnerable populations such as children, seniors, and those with pre-existing respiratory conditions are particularly at risk.

The fine particles of silica dust can travel significant distances from their source, especially when stirred up by large volumes of truck traffic. Even with dust suppression measures, the sheer increase in heavy vehicle movements heightens the risk of airborne particulate matter in residential and school zones near the highway. This situation could lead to increased rates of asthma, bronchitis, and other respiratory ailments in our community.

Traffic and Road Safety Concerns

The addition of over 500 trucks per day on our highway will not only exacerbate air quality issues but also raise serious traffic safety concerns. State Road Highway 60 is already heavily used, and this increase will contribute to congestion, longer commute times, and a higher likelihood of traffic accidents. Large trucks require more stopping distance and have larger blind spots, which can increase the risk of collisions, especially in areas where there are driveways, crosswalks, or school bus stops.

The increased traffic will also accelerate wear and tear on our roads, leading to more frequent maintenance needs and potential hazards such as potholes and deteriorating pavement. This can pose further risks to motorists, cyclists, and pedestrians alike. Roughly half of these trucks will pass west through Lake Wales congested commercial district as well as local schools.

Our community's health and safety must remain a top priority. I urge you to fully evaluate the risks and deny this appeal proposal.

Thank you for your attention to these critical issues.

Sincerely,

Name: Pamela Rupp

Traffic and Road Safety Concerns

The addition of over 500 trucks per day on our highway will not only exacerbate air quality issues but also raise serious traffic safety concerns. State Road Highway 60 is already heavily used, and this increase will contribute to congestion, longer commute times, and a higher likelihood of traffic accidents. Large trucks require more stopping distance and have larger blind spots, which can increase the risk of collisions, especially in areas where there are driveways, crosswalks, or school bus stops.

The increased traffic will also accelerate wear and tear on our roads, leading to more frequent maintenance needs and potential hazards such as potholes and deteriorating pavement. This can pose further risks to motorists, cyclists, and pedestrians alike. Roughly half of these trucks will pass west through Lake Wales congested commercial district as well as local schools.

Our community's health and safety must remain a top priority. I urge you to fully evaluate the risks and deny this appeal proposal.

Thank you for your attention to these critical issues.

Sincerely,

Concerns Regarding Health Impacts of Silica Dust and Increased Traffic

December 29, 2025

Saddlebag Lake Resort, Lake Wales Florida

To the Honorable County Commissioners and Planning Department,

I am writing as a concerned resident regarding the proposed development of a Sand Mine pit that is expected to result in the daily addition of more than 500 trucks travelling along our already busy highway, State Road 60. I respectfully urge you to consider the significant health and safety impacts this proposal may have on our community, our lives matter.

Health Impacts of Silica Dust

One of the most pressing concerns is the increased exposure to respirable crystalline silica dust. Silica dust, generated from activities such as construction, mining, and heavy truck traffic, is a known health hazard. Prolonged or repeated exposure can lead to serious respiratory illnesses, including silicosis, chronic obstructive pulmonary disease (COPD), and even lung cancer. Vulnerable populations such as children, seniors, and those with pre-existing respiratory conditions are particularly at risk.

The fine particles of silica dust can travel significant distances from their source, especially when stirred up by large volumes of truck traffic. Even with dust suppression measures, the sheer increase in heavy vehicle movements heightens the risk of airborne particulate matter in residential and school zones near the highway. This situation could lead to increased rates of asthma, bronchitis, and other respiratory ailments in our community.

One of the most pressing concerns is the increased exposure to respirable crystalline silica dust. Silica dust, generated from activities such as construction, mining, and heavy truck traffic, is a known health hazard. Prolonged or repeated exposure can lead to serious respiratory illnesses, including silicosis, chronic obstructive pulmonary disease (COPD), and even lung cancer. Vulnerable populations such as children, seniors, and those with pre-existing respiratory conditions are particularly at risk.

The fine particles of silica dust can travel significant distances from their source, especially when stirred up by large volumes of truck traffic. Even with dust suppression measures, the sheer increase in heavy vehicle movements heightens the risk of airborne particulate matter in residential and school zones near the highway. This situation could lead to increased rates of asthma, bronchitis, and other respiratory ailments in our community.

Traffic and Road Safety Concerns

The addition of over 500 trucks per day on our highway will not only exacerbate air quality issues but also raise serious traffic safety concerns. State Road Highway 60 is already heavily used, and this increase will contribute to congestion, longer commute times, and a higher likelihood of traffic accidents. Large trucks require more stopping distance and have larger blind spots, which can increase the risk of collisions, especially in areas where there are driveways, crosswalks, or school bus stops.

The increased traffic will also accelerate wear and tear on our roads, leading to more frequent maintenance needs and potential hazards such as potholes and deteriorating pavement. This can pose further risks to motorists, cyclists, and pedestrians alike. Roughly half of these trucks will pass west through Lake Wales congested commercial district as well as local schools.

Our community's health and safety must remain a top priority. I urge you to fully evaluate the risks and deny this appeal proposal.

Thank you for your attention to these critical issues.

Sincerely,

Name: BRYAN S. BOETTGER

Concerns Regarding Health Impacts of Silica Dust and Increased Traffic

December 29, 2025

Saddlebag Lake Resort, Lake Wales Florida

To the Honorable County Commissioners and Planning Department,

I am writing as a concerned resident regarding the proposed development of a Sand Mine pit that is expected to result in the daily addition of more than 500 trucks travelling along our already busy highway, State Road 60. I respectfully urge you to consider the significant health and safety impacts this proposal may have on our community, our lives matter.

Health Impacts of Silica Dust

One of the most pressing concerns is the increased exposure to respirable crystalline silica dust. Silica dust, generated from activities such as construction, mining, and heavy truck traffic, is a known health hazard. Prolonged or repeated exposure can lead to serious respiratory illnesses, including silicosis, chronic obstructive pulmonary disease (COPD), and even lung cancer. Vulnerable populations such as children, seniors, and those with pre-existing respiratory conditions are particularly at risk.

Concerns Regarding Health Impacts of Silica Dust and Increased Traffic

December 29, 2025

Saddlebag Lake Resort, Lake Wales Florida

To the Honorable County Commissioners and Planning Department,

I am writing as a concerned resident regarding the proposed development of a Sand Mine pit that is expected to result in the daily addition of more than 500 trucks travelling along our already busy highway, State Road 60. I respectfully urge you to consider the significant health and safety impacts this proposal may have on our community, our lives matter.

Health Impacts of Silica Dust

One of the most pressing concerns is the increased exposure to respirable crystalline silica dust. Silica dust, generated from activities such as construction, mining, and heavy truck traffic, is a known health hazard. Prolonged or repeated exposure can lead to serious respiratory illnesses, including silicosis, chronic obstructive pulmonary disease (COPD), and even lung cancer. Vulnerable populations such as children, seniors, and those with pre-existing respiratory conditions are particularly at risk.

The fine particles of silica dust can travel significant distances from their source, especially when stirred up by large volumes of truck traffic. Even with dust suppression measures, the sheer increase in heavy vehicle movements heightens the risk of airborne particulate matter in residential and school zones near the highway. This situation could lead to increased rates of asthma, bronchitis, and other respiratory ailments in our community.

Traffic and Road Safety Concerns

The addition of over 500 trucks per day on our highway will not only exacerbate air quality issues but also raise serious traffic safety concerns. State Road Highway 60 is already heavily used, and this increase will contribute to congestion, longer commute times, and a higher likelihood of traffic accidents. Large trucks require more stopping distance and have larger blind spots, which can increase the risk of collisions, especially in areas where there are driveways, crosswalks, or school bus stops.

The increased traffic will also accelerate wear and tear on our roads, leading to more frequent maintenance needs and potential hazards such as potholes and deteriorating pavement. This can pose further risks to motorists, cyclists, and pedestrians alike. Roughly half of these trucks will pass west through Lake Wales congested commercial district as well as local schools.

Our community's health and safety must remain a top priority. I urge you to fully evaluate the risks and deny this appeal proposal.

Thank you for your attention to these critical issues.

Sincerely,

The addition of over 500 trucks per day on our highway will not only exacerbate air quality issues but also raise serious traffic safety concerns. State Road Highway 60 is already heavily used, and this increase will contribute to congestion, longer commute times, and a higher likelihood of traffic accidents. Large trucks require more stopping distance and have larger blind spots, which can increase the risk of collisions, especially in areas where there are driveways, crosswalks, or school bus stops.

The increased traffic will also accelerate wear and tear on our roads, leading to more frequent maintenance needs and potential hazards such as potholes and deteriorating pavement. This can pose further risks to motorists, cyclists, and pedestrians alike. Roughly half of these trucks will pass west through Lake Wales congested commercial district as well as local schools.

Our community's health and safety must remain a top priority. I urge you to fully evaluate the risks and deny this appeal proposal.

Thank you for your attention to these critical issues.

Sincerely,

Name: PATRICIA RIGG

Concerns Regarding Health Impacts of Silica Dust and Increased Traffic

December 29, 2025

Saddlebag Lake Resort, Lake Wales Florida

To the Honorable County Commissioners and Planning Department,

I am writing as a concerned resident regarding the proposed development of a Sand Mine pit that is expected to result in the daily addition of more than 500 trucks travelling along our already busy highway, State Road 60. I respectfully urge you to consider the significant health and safety impacts this proposal may have on our community, our lives matter.

Health Impacts of Silica Dust

One of the most pressing concerns is the increased exposure to respirable crystalline silica dust. Silica dust, generated from activities such as construction, mining, and heavy truck traffic, is a known health hazard. Prolonged or repeated exposure can lead to serious respiratory illnesses, including silicosis, chronic obstructive pulmonary disease (COPD), and even lung cancer. Vulnerable populations such as children, seniors, and those with pre-existing respiratory conditions are particularly at risk.

The fine particles of silica dust can travel significant distances from their source, especially when stirred up by large volumes of truck traffic. Even with dust suppression measures, the sheer increase in heavy vehicle movements heightens the risk of airborne particulate matter in residential and school zones near the highway. This situation could lead to increased rates of asthma, bronchitis, and other respiratory ailments in our community.

Traffic and Road Safety Concerns

The addition of over 500 trucks per day on our highway will not only exacerbate air quality issues but also raise serious traffic safety concerns. State Road Highway 60 is already heavily used, and this increase will contribute to congestion, longer commute times, and a higher likelihood of traffic accidents. One of the most pressing concerns is the increased exposure to respirable crystalline silica dust. Silica dust, generated from activities such as construction, mining, and heavy truck traffic, is a known health hazard. Prolonged or repeated exposure can lead to serious respiratory illnesses, including silicosis, chronic obstructive pulmonary disease (COPD), and even lung cancer. Vulnerable populations such as children, seniors, and those with pre-existing respiratory conditions are particularly at risk.

The fine particles of silica dust can travel significant distances from their source, especially when stirred up by large volumes of truck traffic. Even with dust suppression measures, the sheer increase in heavy vehicle movements heightens the risk of airborne particulate matter in residential and school zones near the highway. This situation could lead to increased rates of asthma, bronchitis, and other respiratory ailments in our community.

Traffic and Road Safety Concerns

The addition of over 500 trucks per day on our highway will not only exacerbate air quality issues but also raise serious traffic safety concerns. State Road Highway 60 is already heavily used, and this increase will contribute to congestion, longer commute times, and a higher likelihood of traffic accidents. Large trucks require more stopping distance and have larger blind spots, which can increase the risk of collisions, especially in areas where there are driveways, crosswalks, or school bus stops.

The increased traffic will also accelerate wear and tear on our roads, leading to more frequent maintenance needs and potential hazards such as potholes and deteriorating pavement. This can pose further risks to motorists, cyclists, and pedestrians alike. Roughly half of these trucks will pass west through Lake Wales congested commercial district as well as local schools.

Our community's health and safety must remain a top priority. I urge you to fully evaluate the risks and deny this appeal proposal.

Thank you for your attention to these critical issues.

Sincerely,

Concerns Regarding Health Impacts of Silica Dust and Increased Traffic

December 29, 2025

Saddlebag Lake Resort, Lake Wales Florida

To the Honorable County Commissioners and Planning Department,

I am writing as a concerned resident regarding the proposed development of a Sand Mine pit that is expected to result in the daily addition of more than 500 trucks travelling along our already busy highway, State Road 60. I respectfully urge you to consider the significant health and safety impacts this proposal may have on our community, our lives matter.

Health Impacts of Silica Dust

One of the most pressing concerns is the increased exposure to respirable crystalline silica dust. Silica dust, generated from activities such as construction, mining, and heavy truck traffic, is a known health hazard. Prolonged or repeated exposure can lead to serious respiratory illnesses, including silicosis, chronic obstructive pulmonary disease (COPD), and even lung cancer. Vulnerable populations such as children, seniors, and those with pre-existing respiratory conditions are particularly at risk.

Concerns Regarding Health Impacts of Silica Dust and Increased Traffic

December 29, 2025

Saddlebag Lake Resort, Lake Wales Florida

To the Honorable County Commissioners and Planning Department,

I am writing as a concerned resident regarding the proposed development of a Sand Mine pit that is expected to result in the daily addition of more than 500 trucks travelling along our already busy highway, State Road 60. I respectfully urge you to consider the significant health and safety impacts this proposal may have on our community, our lives matter.

Health Impacts of Silica Dust

One of the most pressing concerns is the increased exposure to respirable crystalline silica dust. Silica dust, generated from activities such as construction, mining, and heavy truck traffic, is a known health hazard. Prolonged or repeated exposure can lead to serious respiratory illnesses, including silicosis, chronic obstructive pulmonary disease (COPD), and even lung cancer. Vulnerable populations such as children, seniors, and those with pre-existing respiratory conditions are particularly at risk.

The fine particles of silica dust can travel significant distances from their source, especially when stirred up by large volumes of truck traffic. Even with dust suppression measures, the sheer increase in heavy vehicle movements heightens the risk of airborne particulate matter in residential and school zones near the highway. This situation could lead to increased rates of asthma, bronchitis, and other respiratory ailments in our community.

Traffic and Road Safety Concerns

The addition of over 500 trucks per day on our highway will not only exacerbate air quality issues but also raise serious traffic safety concerns. State Road Highway 60 is already heavily used, and this increase will contribute to congestion, longer commute times, and a higher likelihood of traffic accidents. Large trucks require more stopping distance and have larger blind spots, which can increase the risk of collisions, especially in areas where there are driveways, crosswalks, or school bus stops.

The increased traffic will also accelerate wear and tear on our roads, leading to more frequent maintenance needs and potential hazards such as potholes and deteriorating pavement. This can pose further risks to motorists, cyclists, and pedestrians alike. Roughly half of these trucks will pass west through Lake Wales congested commercial district as well as local schools.

Our community's health and safety must remain a top priority. I urge you to fully evaluate the risks and deny this appeal proposal.

Thank you for your attention to these critical issues.

Sincerely,

Name: BRIAN CRABBE

The addition of over 500 trucks per day on our highway will not only exacerbate air quality issues but also raise serious traffic safety concerns. State Road Highway 60 is already heavily used, and this increase will contribute to congestion, longer commute times, and a higher likelihood of traffic accidents. Large trucks require more stopping distance and have larger blind spots, which can increase the risk of collisions, especially in areas where there are driveways, crosswalks, or school bus stops.

The increased traffic will also accelerate wear and tear on our roads, leading to more frequent maintenance needs and potential hazards such as potholes and deteriorating pavement. This can pose further risks to motorists, cyclists, and pedestrians alike. Roughly half of these trucks will pass west through Lake Wales congested commercial district as well as local schools.

Our community's health and safety must remain a top priority. I urge you to fully evaluate the risks and deny this appeal proposal.

Thank you for your attention to these critical issues.

Sincerely,

Concerns Regarding Health Impacts of Silica Dust and Increased Traffic

December 29, 2025

Saddlebag Lake Resort, Lake Wales Florida

To the Honorable County Commissioners and Planning Department,

I am writing as a concerned resident regarding the proposed development of a Sand Mine pit that is expected to result in the daily addition of more than 500 trucks travelling along our already busy highway, State Road 60. I respectfully urge you to consider the significant health and safety impacts this proposal may have on our community, our lives matter.

Health Impacts of Silica Dust

One of the most pressing concerns is the increased exposure to respirable crystalline silica dust. Silica dust, generated from activities such as construction, mining, and heavy truck traffic, is a known health hazard. Prolonged or repeated exposure can lead to serious respiratory illnesses, including silicosis, chronic obstructive pulmonary disease (COPD), and even lung cancer. Vulnerable populations such as children, seniors, and those with pre-existing respiratory conditions are particularly at risk.

The fine particles of silica dust can travel significant distances from their source, especially when stirred up by large volumes of truck traffic. Even with dust suppression measures, the sheer increase in heavy vehicle movements heightens the risk of airborne particulate matter in residential and school zones near the highway. This situation could lead to increased rates of asthma, bronchitis, and other respiratory ailments in our community.

Traffic and Road Safety Concerns

The addition of over 500 trucks per day on our highway will not only exacerbate air quality issues but also raise serious traffic safety concerns. Health Impacts of Silica Dust

One of the most pressing concerns is the increased exposure to respirable crystalline silica dust. Silica dust, generated from activities such as construction, mining, and heavy truck traffic, is a known health hazard. Prolonged or repeated exposure can lead to serious respiratory illnesses, including silicosis, chronic obstructive pulmonary disease (COPD), and even lung cancer. Vulnerable populations such as children, seniors, and those with pre-existing respiratory conditions are particularly at risk. *

The fine particles of silica dust can travel significant distances from their source, especially when stirred up by large volumes of truck traffic. Even with dust suppression measures, the sheer increase in heavy vehicle movements heightens the risk of airborne particulate matter in residential and school zones near the highway. This situation could lead to increased rates of asthma, bronchitis, and other respiratory ailments in our community.

Traffic and Road Safety Concerns

The addition of over 500 trucks per day on our highway will not only exacerbate air quality issues but also raise serious traffic safety concerns. State Road Highway 60 is already heavily used, and this increase will contribute to congestion, longer commute times, and a higher likelihood of traffic accidents. Large trucks require more stopping distance and have larger blind spots, which can increase the risk of collisions, especially in areas where there are driveways, crosswalks, or school bus stops.

The increased traffic will also accelerate wear and tear on our roads, leading to more frequent maintenance needs and potential hazards such as potholes and deteriorating pavement. This can pose further risks to motorists, cyclists, and pedestrians alike. Roughly half of these trucks will pass west through Lake Wales congested commercial district as well as local schools.

Our community's health and safety must remain a top priority. I urge you to fully evaluate the risks and deny this appeal proposal.

Thank you for your attention to these critical issues.

Sincerely,

Concerns Regarding Health Impacts of Silica Dust and Increased Traffic

December 29, 2025

Saddlebag Lake Resort, Lake Wales Florida

To the Honorable County Commissioners and Planning Department,

I am writing as a concerned resident regarding the proposed development of a Sand Mine pit that is expected to result in the daily addition of more than 500 trucks travelling along our already busy highway, State Road 60. I respectfully urge you to consider the significant health and safety impacts this proposal may have on our community, our lives matter.

Health Impacts of Silica Dust

One of the most pressing concerns is the increased exposure to respirable crystalline silica dust. Silica dust, generated from activities such as construction, mining, and heavy truck traffic, is a known health hazard. Prolonged or repeated exposure can lead to serious respiratory illnesses, including silicosis, chronic obstructive pulmonary disease (COPD), and even lung cancer. Vulnerable populations such as children, seniors, and those with pre-existing respiratory conditions are particularly at risk.

Concerns Regarding Health Impacts of Silica Dust and Increased Traffic

December 29, 2025

Saddlebag Lake Resort, Lake Wales Florida

To the Honorable County Commissioners and Planning Department,

I am writing as a concerned resident regarding the proposed development of a Sand Mine pit that is expected to result in the daily addition of more than 500 trucks travelling along our already busy highway, State Road 60. I respectfully urge you to consider the significant health and safety impacts this proposal may have on our community, our lives matter.

Health Impacts of Silica Dust

One of the most pressing concerns is the increased exposure to respirable crystalline silica dust. Silica dust, generated from activities such as construction, mining, and heavy truck traffic, is a known health hazard. Prolonged or repeated exposure can lead to serious respiratory illnesses, including silicosis, chronic obstructive pulmonary disease (COPD), and even lung cancer. Vulnerable populations such as children, seniors, and those with pre-existing respiratory conditions are particularly at risk.

The fine particles of silica dust can travel significant distances from their source, especially when stirred up by large volumes of truck traffic. Even with dust suppression measures, the sheer increase in heavy vehicle movements heightens the risk of airborne particulate matter in residential and school zones near the highway. This situation could lead to increased rates of asthma, bronchitis, and other respiratory ailments in our community.

Traffic and Road Safety Concerns

The addition of over 500 trucks per day on our highway will not only exacerbate air quality issues but also raise serious traffic safety concerns. State Road Highway 60 is already heavily used, and this increase will contribute to congestion, longer commute times, and a higher likelihood of traffic accidents. Large trucks require more stopping distance and have larger blind spots, which can increase the risk of collisions, especially in areas where there are driveways, crosswalks, or school bus stops.

The increased traffic will also accelerate wear and tear on our roads, leading to more frequent maintenance needs and potential hazards such as potholes and deteriorating pavement. This can pose further risks to motorists, cyclists, and pedestrians alike. Roughly half of these trucks will pass west through Lake Wales congested commercial district as well as local schools.

Our community's health and safety must remain a top priority. I urge you to fully evaluate the risks and deny this appeal proposal.

Thank you for your attention to these critical issues.

Sincerely,

Name: Bruce & Sue Toothaker

This situation could lead to increased rates of asthma, bronchitis, and other respiratory ailments in our community.

Traffic and Road Safety Concerns

The addition of over 500 trucks per day on our highway will not only exacerbate air quality issues but also raise serious traffic safety concerns. State Road Highway 60 is already heavily used, and this increase will contribute to congestion, longer commute times, and a higher likelihood of traffic accidents. Large trucks require more stopping distance and have larger blind spots, which can increase the risk of collisions, especially in areas where there are driveways, crosswalks, or school bus stops.

The increased traffic will also accelerate wear and tear on our roads, leading to more frequent maintenance needs and potential hazards such as potholes and deteriorating pavement. This can pose further risks to motorists, cyclists, and pedestrians alike. Roughly half of these trucks will pass west through Lake Wales congested commercial district as well as local schools.

Our community's health and safety must remain a top priority. I urge you to fully evaluate the risks and deny this appeal proposal.

Thank you for your attention to these critical issues.

Sincerely,

Concerns Regarding Health Impacts of Silica Dust and Increased Traffic

December 29, 2025

Saddlebag Lake Resort, Lake Wales Florida

To the Honorable County Commissioners and Planning Department,

I am writing as a concerned resident regarding the proposed development of a Sand Mine pit that is expected to result in the daily addition of more than 500 trucks travelling along our already busy highway, State Road 60. I respectfully urge you to consider the significant health and safety impacts this proposal may have on our community, our lives matter.

Health Impacts of Silica Dust

One of the most pressing concerns is the increased exposure to respirable crystalline silica dust. Silica dust, generated from activities such as construction, mining, and heavy truck traffic, is a known health hazard. Prolonged or repeated exposure can lead to serious respiratory illnesses, including silicosis, chronic obstructive pulmonary disease (COPD), and even lung cancer. Vulnerable populations such as children, seniors, and those with pre-existing respiratory conditions are particularly at risk.

The fine particles of silica dust can travel significant distances from their source, especially when stirred up by large volumes of truck traffic. Even with dust suppression measures, the sheer increase in heavy vehicle movements heightens the risk of airborne particulate matter in residential and school zones near the highway. This situation could lead to increased rates of asthma, bronchitis, and other respiratory ailments in our community.

Traffic and Road Safety Concerns

The addition of over 500 trucks per day on our highway will not only exacerbate air quality issues but also raise serious traffic safety concerns. LDCU – 2025-29 Appeal

Protecting Our Environment, Health, and Community

Date: 2025-12-22

To: County Commissioners and Planning Department

Dear Commissioners and Planners,

I am writing as a resident of Saddlebag Lake Resort to express my deep concern about the proposed sand mine development appeal next to our community. As stewards of Saddlebag Lake Resorts safety, health and wellness, we rely on your commitment to uphold the values of community protection, environmental preservation, and transparent governance in all development matters.

Environmental Impact

Sand mining can inflict irreversible damage on our local ecosystem. The removal of topsoil and natural vegetation threatens the delicate balance of our environment, leading to soil erosion, water contamination, and the destruction of habitats essential for native plant and animal species. The dust generated by mining activities can degrade air quality and settle on nearby land, harming crops and gardens, and reducing the overall natural beauty of our rural area.

Health and Welfare Concerns

Numerous studies have shown that sand mines can pose significant health risks to nearby residents. Airborne particulate matter—including fine silica dust—has the strong potential to cause silicosis, lung cancer, heart disease, stroke, COPD among other health issues. Increased truck traffic and noise pollution also disrupt the peace and safety of our neighbourhoods, raising concerns about road safety and the overall quality of life.

Impact on Wildlife

Our community is home to a rich variety of wildlife, including birds, mammals, amphibians, and insects that depend on the undisturbed land surrounding our homes. The disruption and fragmentation of these habitats caused by mining operations may force species to relocate, reduce biodiversity, and undermine conservation efforts that our residents and local authorities have worked hard to maintain.

Commitment to Community Values

We appreciate the County Commissioners' ongoing dedication to managing community safety, preserving health and wellness, and ensuring transparent communication about upcoming developments. We urge you to continue honoring these commitments by rejecting the sand mine proposal near our HOA site as the Planning Board Commissioners did in an unprecedented voting result that LDCU-2025-29 is incompatible. Our community deserves to thrive in a safe, healthy, and unspoiled environment that honors Saddlebag's character and ecological integrity.

Transparency and Public Engagement

We kindly request that you provide clear and timely updates regarding the status of this development. Moreover, we ask for meaningful public consultation before any decisions are finalized, ensuring that the voices of those most affected are heard and respected.

Thank you for considering our concerns and for your steadfast dedication to the wellbeing of our community. Please do not hesitate to contact us for further information or to arrange a meeting with our HOA representatives.

Sincerely,

LDCU – 2025-29 Appeal

Dear Commissioners and Planners,

I am writing as a resident of Saddlebag Lake Resort to express my deep concern about the proposed sand mine development appeal next to our community. As stewards of Saddlebag Lake Resorts safety, health and wellness, we rely on your commitment to uphold the values of community protection, environmental preservation, and transparent governance in all development matters.

Environmental Impact

Sand mining can inflict irreversible damage on our local ecosystem. The removal of topsoil and natural vegetation threatens the delicate balance of our environment, leading to soil erosion, water contamination, and the destruction of habitats essential for native plant and animal species. The dust generated by mining activities can degrade air quality and settle on nearby land, harming crops and gardens, and reducing the overall natural beauty of our rural area.

Health and Welfare Concerns

Numerous studies have shown that sand mines can pose significant health risks to nearby residents. Airborne particulate matter—including fine silica dust—has the strong potential to cause silicosis, lung cancer, heart disease, stroke, COPD among other health issues. Increased truck traffic and noise pollution also disrupt the peace and safety of our neighbourhoods, raising concerns about road safety and the overall quality of life.

Impact on Wildlife

Our community is home to a rich variety of wildlife, including birds, mammals, amphibians, and insects that depend on the undisturbed land surrounding our homes. The disruption and fragmentation of these habitats caused by mining operations may force species to relocate, reduce biodiversity, and undermine conservation efforts that our residents and local authorities have worked hard to maintain.

Commitment to Community Values

We appreciate the County Commissioners' ongoing dedication to managing community safety, preserving health and wellness, and ensuring transparent communication about upcoming developments. We urge you to continue honoring these commitments by rejecting the sand mine proposal near our HOA site as the Planning Board Commissioners did in an unprecedented voting result that LDCU-2025-29 is incompatible. Our community deserves to thrive in a safe, healthy, and unspoiled environment that honors Saddlebag's character and ecological integrity.

Transparency and Public Engagement

We kindly request that you provide clear and timely updates regarding the status of this development. Moreover, we ask for meaningful public consultation before any decisions are finalized, ensuring that the voices of those most affected are heard and respected.

Thank you for considering our concerns and for your steadfast dedication to the wellbeing of our community. Please do not hesitate to contact us for further information or to arrange a meeting with our HOA representatives.

Sincerely,

Gary L. Arbing
